WELCOME THIRD YEAR CLASS

The respiratory system

Objectives of studying the respiratory system:

Provides tissues for gas exchange between air and blood

 Provides chemoreceptors involved in sense of smell

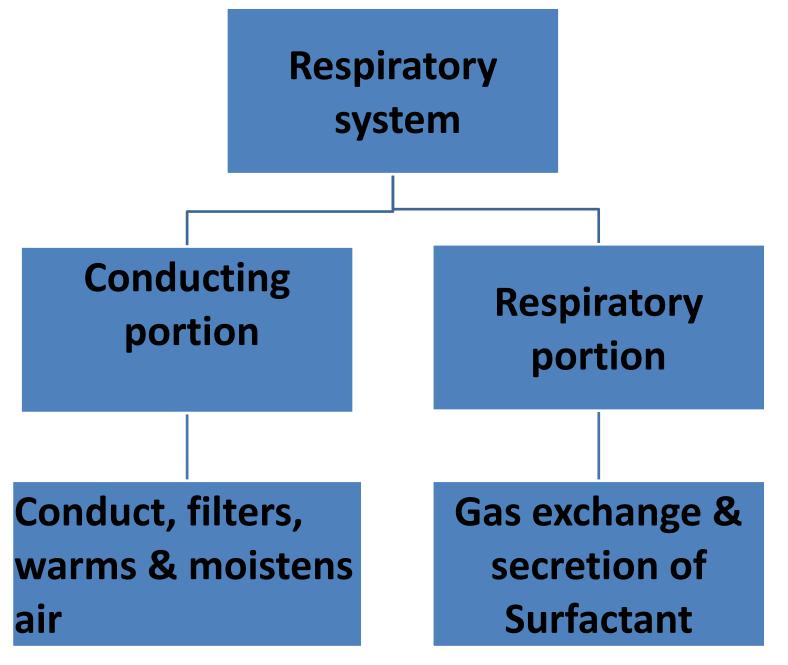

Produces sounds (Phonation)

Learning objectives:

- 1- Recognize & describe the cellular components of respiratory epithelium
- 2- Understand the structure & function of conchae
- 3- Recognize & describe the cellular components of olfactory epithelium
- 4- Describe components of the vocal cords
- 5- Recognize & understand function of epiglottis
- 6-List the tubes that make up the conducting and respiratory portions
- 7- Distinguish between a bronchus, bronchioles & respiratory bronchiole
- 8- List all components that make up the interalveolar septum
- 9- Distinguish between type I & type II alveolar cells, macrophage and endothelium
- 10- Describe the two separate blood supplies to the lung & understand their function

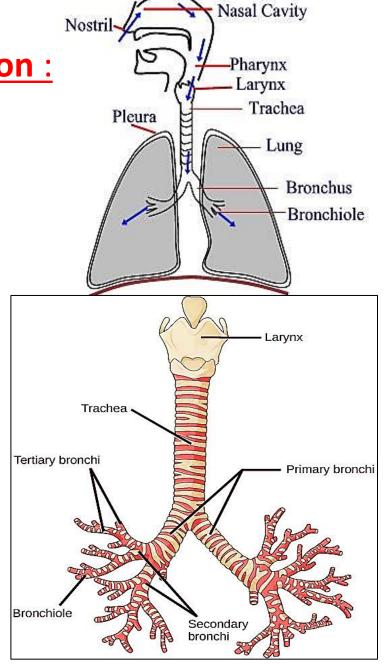

- Types of epithelium in the respiratory system:
- **1- Non- K stratified squamous epith.** → found at nostrils, lingual surface of epiglottis, & true vocal cords
- 2- Respiratory epith. Cover most of the conducting portion of the respiratory tract
- **3- Olfactory epith.** Contains chemoreceptors of smell sensation → superior conchae

4- Alveolar epith. Found in Respiratory portion / alveoli where gas exchange

> A- Parts of The conducting portion :

- Nasal cavities & sinuses
- Nasopharynx
- Larynx
- Trachea
- Bronchi (Rt & Lf)
- 2ry, 3ry bronchi
- Bronchioles
- Terminal bronchioles

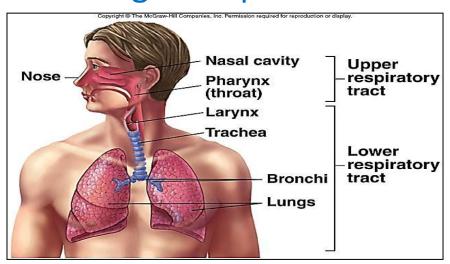

Structure / Function relation in Conducting portion

Cartilage to prevent collapse

 Maintain an open lumen

Elastic fibers & smooth ms. fibers for flexibility ->
 Ability to accommodate expansion & contraction

Respiratory epithelium → Filtering, moisturizing & warming of inspired air

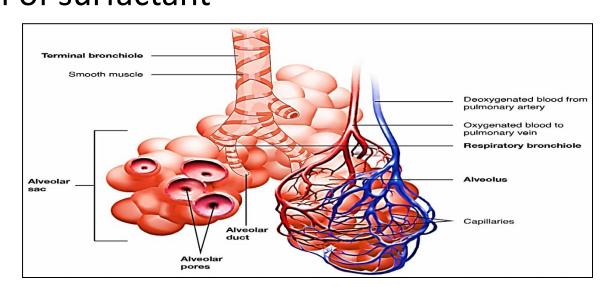

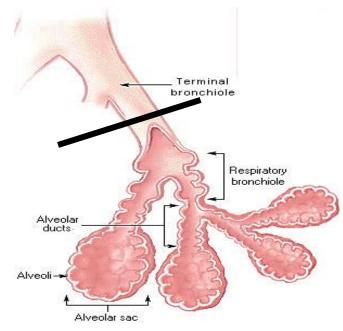

B- Parts of The respiratory portion :

- Respiratory bronchioles
- Alveolar ducts
- Alveolar sacs
- Alveoli

Function of respiratory portion:

Gas (O₂/CO₂) exchange between blood & inspired air Production of surfactant

A- Conducting portion

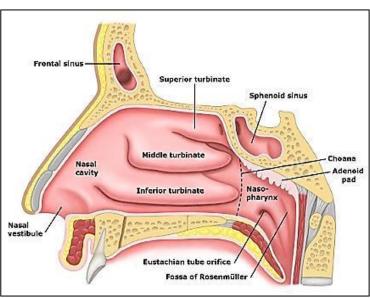

Nasal cavities: separated by a septum (cartilaginous & bony) parts

each consists of: vestibule & nasal fossa

Vestibule:

Is the anterior part

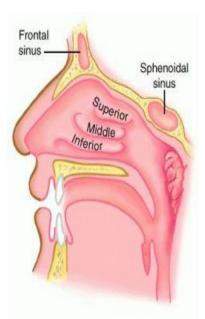

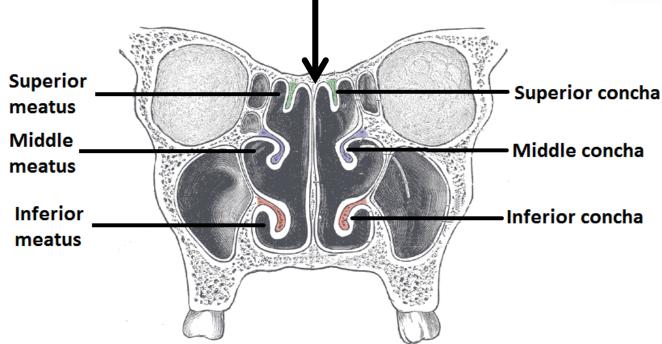

- Lined e thin skin deeper changes → non - keratinized st. squ. epithelium
- hair filters out large dust particles

Nasal fossae:

2 cavities separated by nasal septum

 Their lateral walls contain 3 bony projections (conchae) superior, middle, inferior

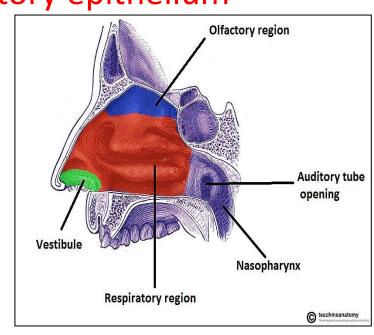

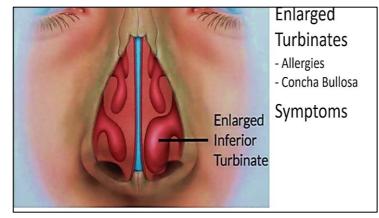

Superior one covered e Olfactory epithelium

Middle & inferior covered e respiratory epithelium

The conchae <u>slow flow of air</u> & <u>increase the surface area</u> of respiratory epithelium for conditioning of the inspired air

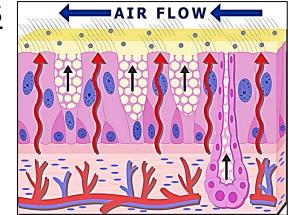

lamina propria beneath RS epith.
 rich with superficial venous plexus (swell bodies)

Swell bodies:

Loops of venous plexus located in of lamina propria of the respiratory epithelium of the nasal cavities

1- Important for conditioning & warming of inhaled air → "counter current flow"

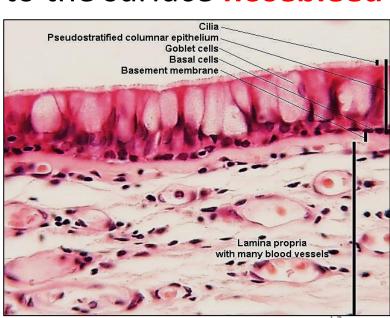

2- Due to their thin wall & proximity to the surface nosebleed

occurs so common

3- Responsible for nasal cycle

4- Allergic reactions & inflammation can cause sever engorgement of swell bodies in both fossa

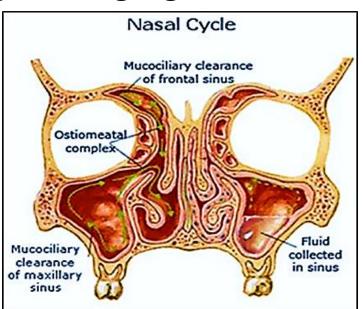

Nasal cycle:

 Every 20-30 min. <u>rhythmic cycles</u> of physiological congestion & decongestion occurs in the mucosa of the nasal cavities. <u>Normally we are not aware of it</u>

 When Swell bodies in lamina propria of <u>one nasal cavity</u> become engorged with blood → distention of conchal mucosa → ↓ flow of air → allowing the engorged Res.

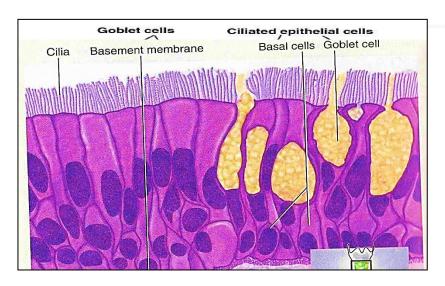

Epith. To recover from dehydration

 The cycle under the control of autonomic nervous system

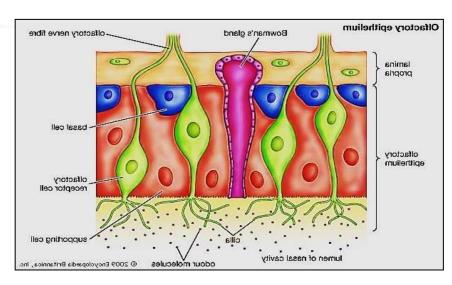

Q:What is the difference between the respiratory & olfactory epithelium?

RESPIRATORY

OLFACTORY

The respiratory epithelium:

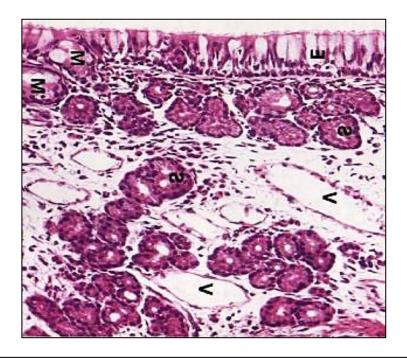

> Pseudostratified columnar ciliated e goblet cells

The olfactory epithelium:

Pseudostratified columnar e <u>chemoreceptors</u> & <u>NO</u> goblet cells
Prof Dr. Hala Elmazar

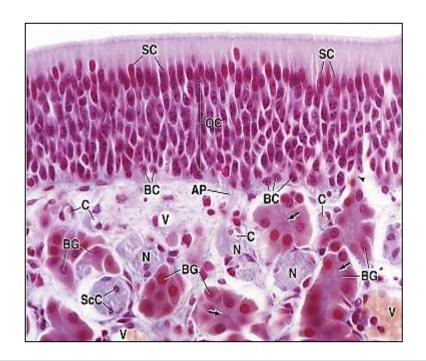

Respiratory mucosa

- Epithelium
- Lamina propria
- Nasal glands (M & S)
 Blood vessels

Olfactory mucosa

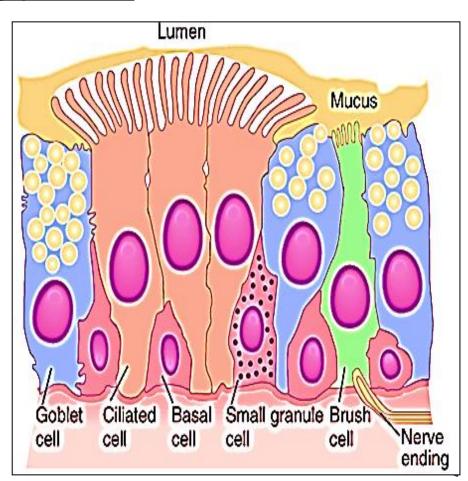

- Epithelium
- Lamina propria
- Olfactory glands (**S only**)
 Blood vessels

The respiratory epithelium

Lines most of the conducting portion

- 5 types of cells are present:
- 1- Columnar ciliated cells
- 2- Goblet cells
- 3- Brush cells
- 4- Basal (stem) cells
- 5- Granule cells (NE cells)

- 1- Columnar ciliated cells: most cells, have motile cilia (300) on apical surface (unidirectional beating)
- 2- Goblet cells: secrete mucus, cover surface to trap bacteria& dust

3- Brush cells: columnar cells e apical microvilli, have basal afferent nerve endings that communicate e trigeminal nerve 5th → give sensory information about the mucosa =

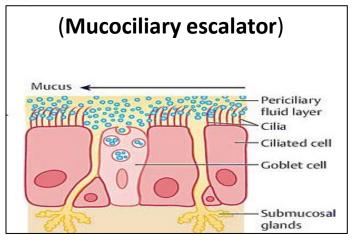

(chemosensory receptors)

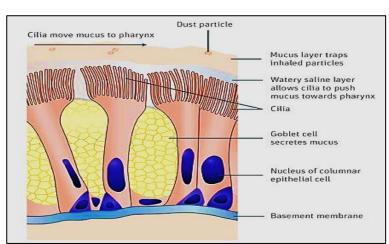

4- Basal cells: small cells, act as stem cells

5- Granule cells: (neuro-endocrine cells):
have basal cytoplasmic granules, secret
hormones (serotonin & catecholamine)
→regulate the caliber & secretions of
airways

- Granular cells: during development they exert a local mitogenic effect, they influence the lengthen of the individual airway branches. <u>In adult</u> they provide local regulation of <u>bronchial</u> or <u>vascular muscle tone</u> in response to <u>hypoxia or hypercapnia</u>
- Serotonin is a cilio- stimulatory i.e. increase ciliary beat frequency (CBF)
- Serotonin induces the release of Ach from columnar ciliated cells \rightarrow release of Ca & ATP \rightarrow \uparrow CBF .
- Serotonin cause \(\Delta\) in periciliary liquid & thus facilitate mucociliary clearance
- Serotonin cause \(\Delta\) in periciliary liquid & thus facilitate mucociliary clearance
- serotonin induces vasoconstriction in pulmonary vasculature → role in Pulmonary hypertension

- The respiratory epithelium rests on lamina propria contain many Nasal glands (serous & mucus) + BV
- The serous sec. serve to facilitate movement of cilia of mucous sec. serve to catch inhaled dirt & bacteria particles inhaled

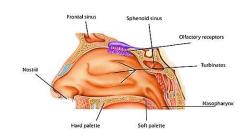

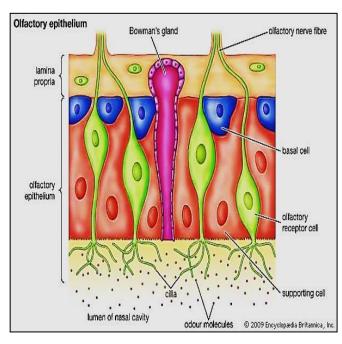

- The blood vessels serve to warm the inspired air (humidity of the lung can be maintained)
- In smokers the proportion of ciliated cells to goblet cells is altered (个 goblet) to trap gaseous pollutants

The olfactory epithelium

Covers the roof of nasal cavities & superior conchae.

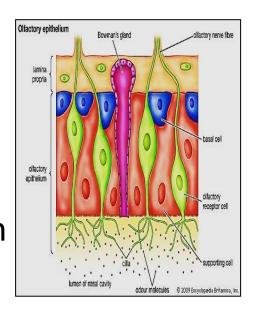

- Contains chemoreceptors of smell
- 3 types of cells are present:
- Olfactory neurons
- 2. Supporting (sustentacular) cells
- 3. Basal cells

- The olfactory epithelium rests on lamina propria contains:
- ✓ BV & olfactory nerve fibers
- ✓ Bowman's glands secrete <u>constant flow</u> of <u>serous fluid</u> → surface → facilitate dissolve of odoriferous substance

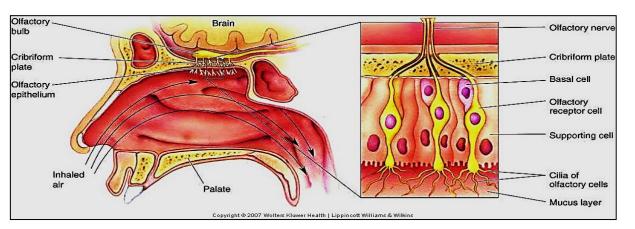

1- Olfactory neurons:

- Bipolar nerve cells (renew 30- 60 days) i.e
 (regenerative neuronal tissue !!)
- Their dendrites extend toward surface
 - → end in swellings (olfactory vesicles) from which cilia arise

- These cilia (10-20) are very long & <u>non motile</u>. It provides large surface for <u>transmembrane chemoreceptors</u>
- Their axons pass to lamina propria to form olfactory n.

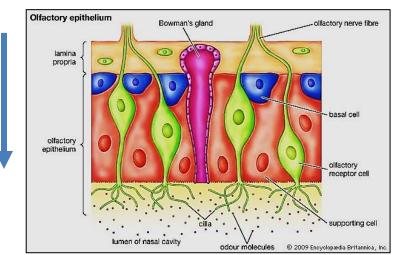

fibers

2- Supporting cells (neuroglia):

- Tall columnar cells e wide apex narrow base
- Their free surface has microvilli
 Tight junctions bind these cells e olfactory cells.

 They secrete <u>odorant binding proteins &</u> express <u>abundant ion channels</u> → role in signal conduction of smell sensation. These cells play role in smell loss (anosmia) in COVID 19

3- Basal cells:

- Small pyramidal cells e basophilic cytoplasm
- Act as stem cells for both olfactory & supporting cells

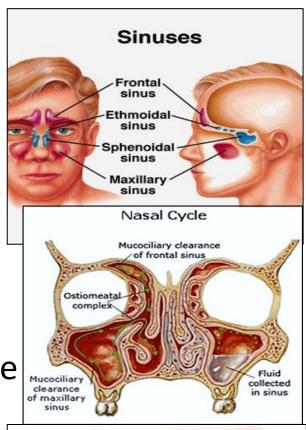

Paranasal sinuses (Bilateral)

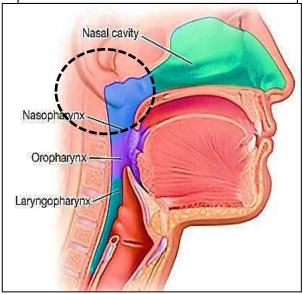

- Frontal, Ethmoidal, Sphenoidal Maxillary
- These cavities open in nasal cavities
- Lined e thin respiratory epith.
 e few goblet cells

Chronic sinusitis = immotile cilia syndrome

Nasopharynx

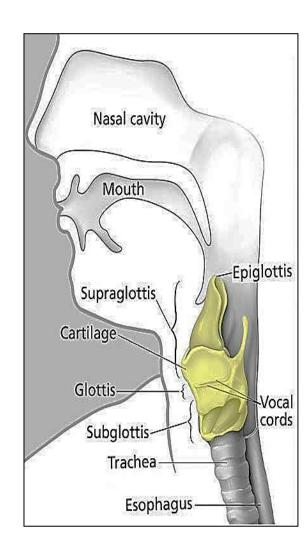

- Lined e respiratory epithelium
- Its lamina propria contains
 pharyngeal tonsil & openings of
 Eustachian tubes

Larynx:

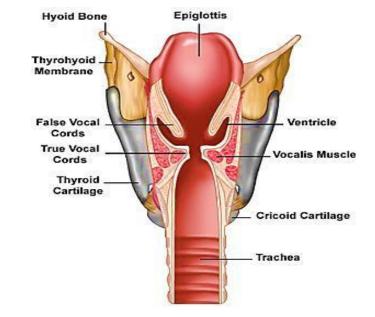

- At the beginning of trachea (4x4cm)
- Its beginning is guarded by epiglottis
- Has 2 functions:
- √ production of voice (vocal cords)
- ✓ Prevent food & fluid from entering the Trachea through the <u>epiglottis</u> (Epiglottis has <u>elastic</u> cartilage)

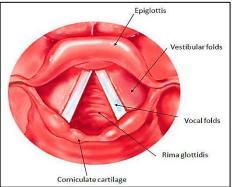

It is lined with respiratory epithelium

Vocal cords:

- 2 pairs of mucosal folds extend in lumen of larynx
- <u>False vocal cords</u> (Upper pair)
- called (vestibular folds)
- covered e <u>respiratory epith.</u>
- guard against entrance of food into larynx (made of <u>vestibular ligament</u>)
- True vocal cords (Lower pair)
- > covered e non-keratinized stratified squamous epith.
- made of ligaments (vocal lig.) & skeletal ms. (Vocalis ms.)
- > tension of cords & distance between them produce sound

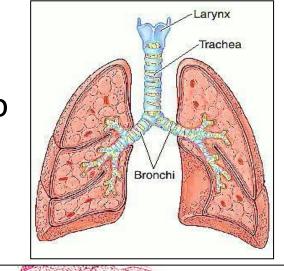

Trachea

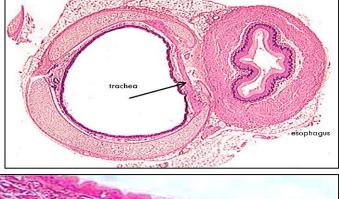

• Tube (12- 14 cm) extends from larynx to bifurcation of bronchi

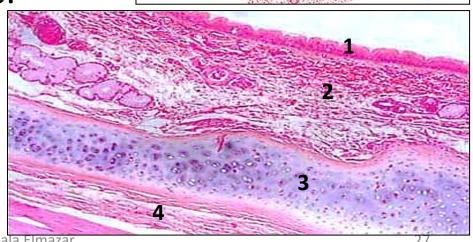

Kept open by about 20 C- shaped (horse shoe) cartilage rings (hyaline cartilage)

- Mucosa
- 2. Submucosa
- 3. Hyaline cartilage
- 4. Adventitia

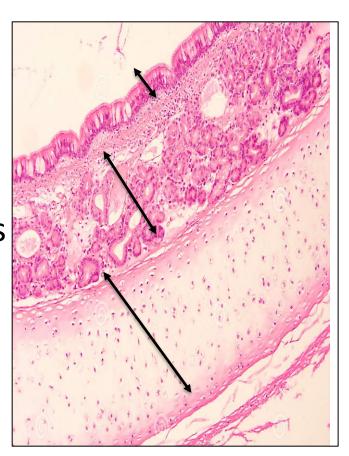

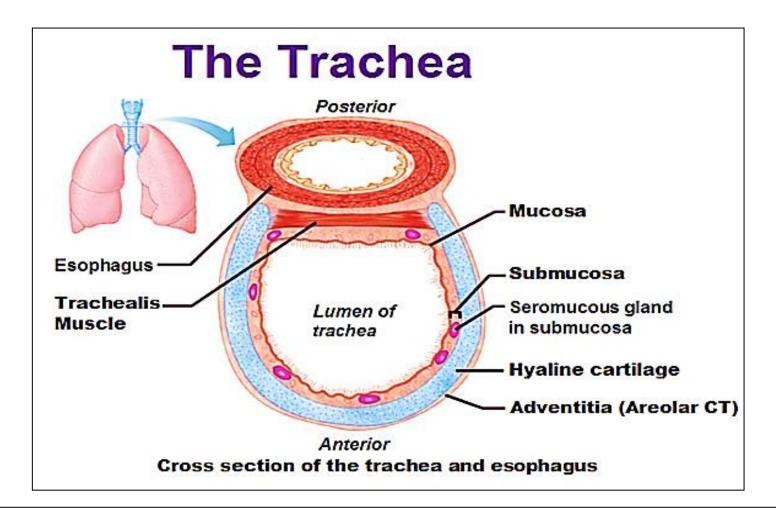

Wall of trachea:

• Mucosa: epithelium – lamina propria – elastic fibers

Epithelium: respiratory epithelium

- <u>Submucosa</u>: loose CT. BV, nerves, Lymphoid nodules, Tracheal glands
- <u>Cartilage layer</u>: C- shaped cartilage rings, the gap between cartilage ends connected by elastic ligament & <u>Trachealis ms (smooth ms)</u>
- Adventitia: loose CT

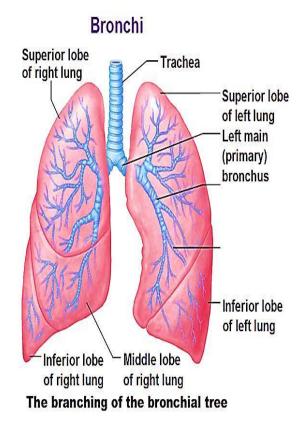

Contraction of the trachealis ms. is important for the cough reflex

Contraction \rightarrow narrowing the tracheal lumen \rightarrow \uparrow the velocity of the expelled air \rightarrow squeezed out

Bronchial tree

- ✓ Primary (Extra pulmonary) bronchi
- ✓ Secondary (Intra-pulmonary) bronchi
- ✓ Bronchioles
- ✓ Terminal bronchioles
- 1ry bronchi: RT & LF→ similar to trachea (but cartilage is a complete ring)

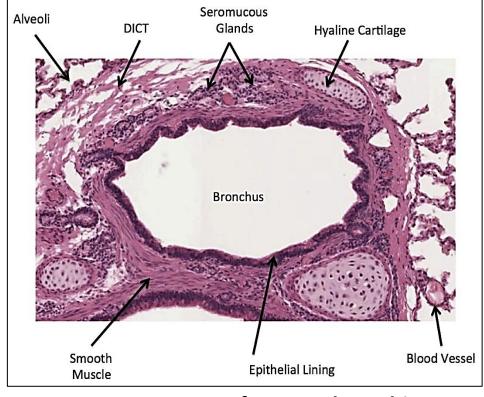

- <u>2ry bronchi</u>: within the lung → divide into 3ry bronchi <u>Its wall is formed of 4 layers (NO Submucosa):</u>
- Mucosa
- Musculosa
- Cartilage plates (isolated plates)

 Mucosa: ↑folded, respiratory epith.,↓goblet cells, lamina propria has elastic fibers & MALT (mucosa associated)

 Musculosa: spiral layers of smooth ms. encircling the

lymphatic tissue)

Cartilage plates:
 muco-serous glands &
 lymph podules found be

Structure of 2ry, 3ry bronchi

lymph nodules found between cartilage plates

Adventitia:

mucosa

Bronchioles

- Small airways 5 ↓ mm
- Its wall has (No submucosa, No cartilage, No glands, No lymphatic nodules)
- Its wall formed of 3 layers

Mucosa:

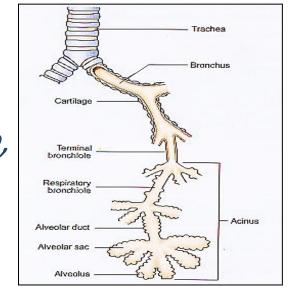

Simple columnar ciliated epithelium e
 Clara cells & NE cells & neuroepithelial bodies
 (chemosensory receptors → O₂ level)

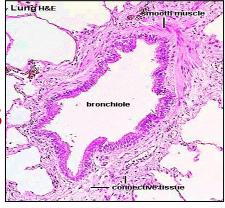

Musculosa:

complete <u>layer of circularly</u> arranged smooth ms. (Asthma attacks)

Adventitia

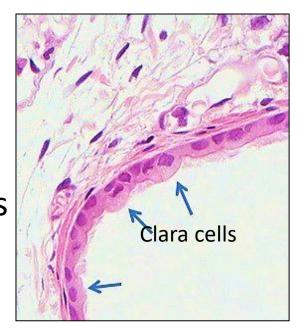

Asthmatic airway

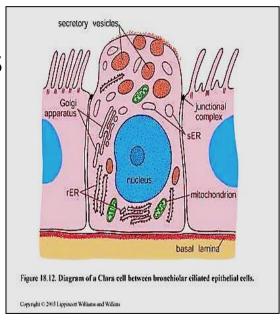

Clara Cells:

- Also called club cells or bronchiolar exocrine cells
- Dome- shaped, non- ciliated,
- Cytoplasm has lots of secretory granules (not mucus) basal rER, apical sER

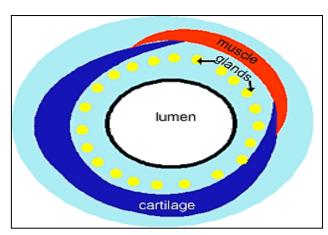

Function:

- Defensive role :glycoprotein granules
 (contain proteolyase & oxidase & cytokines)
- 2. Degradation of inhaled toxins (sER)
- 3. Secretion of surfactant-like substance to prevent collapse of bronchioles
- 4. Act as stem cells
- 5. Mutation → adenocarcinoma of lung

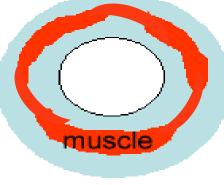

Difference between structure of wall of trachea vs. Wall of intra-pulmonary bronchi & bronchiole

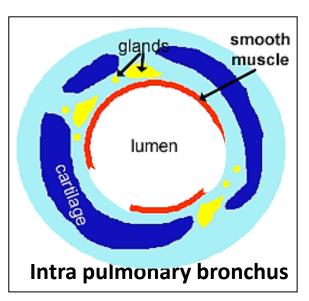

Trachea

N.B: Smooth muscle component increases in proportion and continuity as the air passage decreases in size. Then decrease again till disappear in the respiratory portion

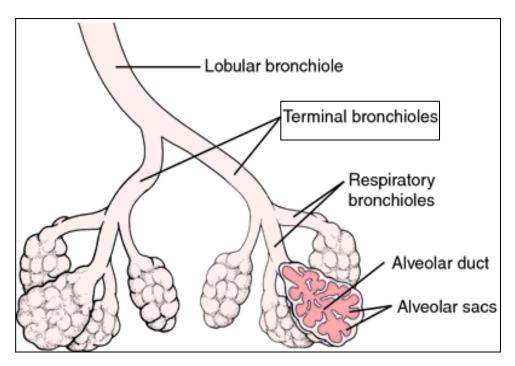

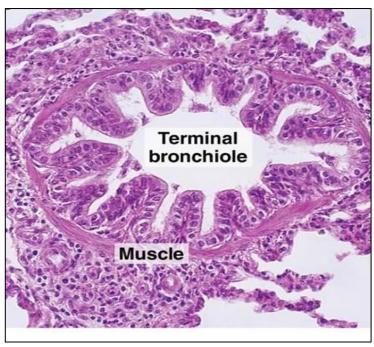

Bronchiole

N. B: if cartilage is present, it is a "bronchus," but if cartilage is absent the airway is a "bronchiole."

Terminal bronchioles:

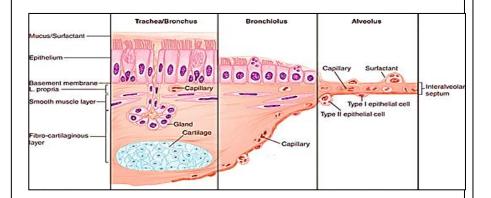

- The smallest & last part of conducting portion
- Lining epithelium: Simple cubical ciliated e Clara cells
- Secondary pulmonary lobule: is the lobule supplied by a terminal bronchiole that branches into respiratory bronchioles.

Prof Dr Hala Elmazar

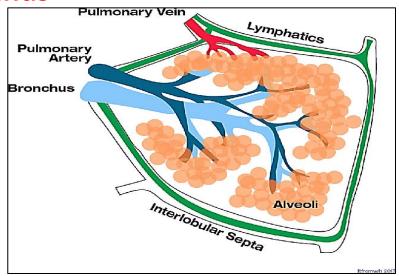

Changes occur in the epith. of conducting portion as it branches

Bronchial tree can be as small as 0.5 mm diameter and as they get smaller some changes occur. First, the glands disappear, then goblet cells . there is also an epithelial transition from the pseudostratified RE to simple columnar, then to a low cuboidal type. Along the way ciliation disappears.

secretion ends before ciliation does. Why?

Pulmonary lobule vs pulmonary acinus

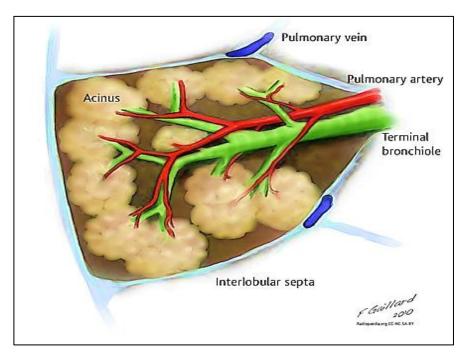

2ry Pulmonary lobule:

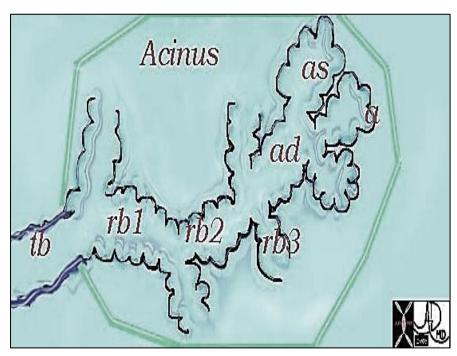

Bigger, lung unit supplied by 3-5 terminal bronchioles derived from single bronchus & surrounded by CT(3- 12 acini & 30- 50 1 ry L.)

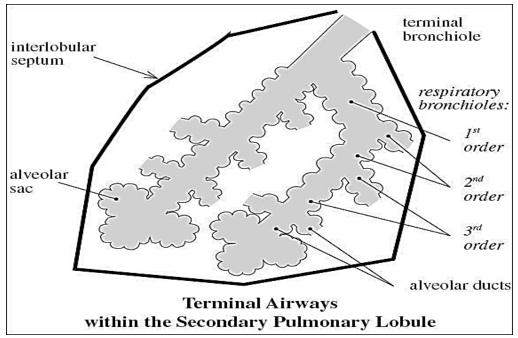

Pulmonary acinus: lung unit distal to single terminal bronchiole includes resp.B, alveolar ducts, sacs, alveoli

1ry pulmonary lobule: smaller than acinus includes lung unit distal to respiratory B, alveolar ducts, sacs ,alveoli

Prof Dr Hala

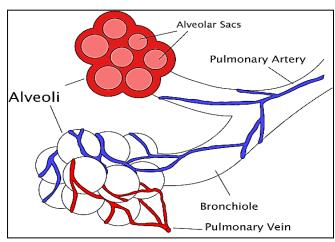

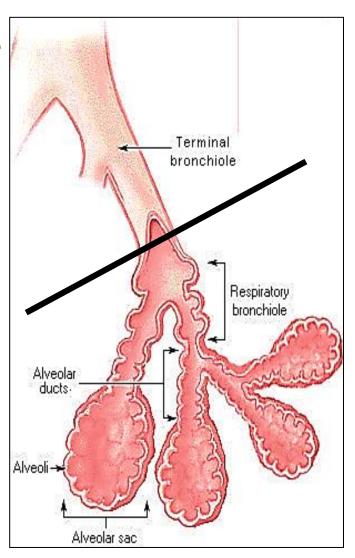

B- respiratory portion

• Is where gas exchange takes place

- Includes:
- 1. Respiratory bronchioles
- 2. Alveolar ducts
- 3. Alveolar sacs
- 4. Alveoli

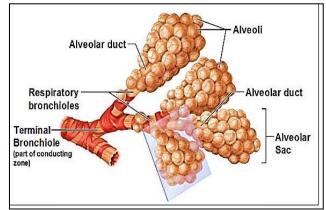

Respiratory bronchioles (RB):

 Transitional part between conducting & respiratory portions, still bronchiole but shorter & thinner

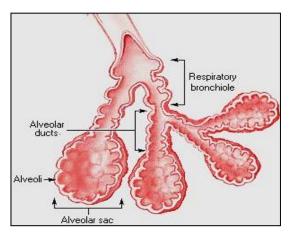

<u>Lined with simple cubical ciliated e</u>

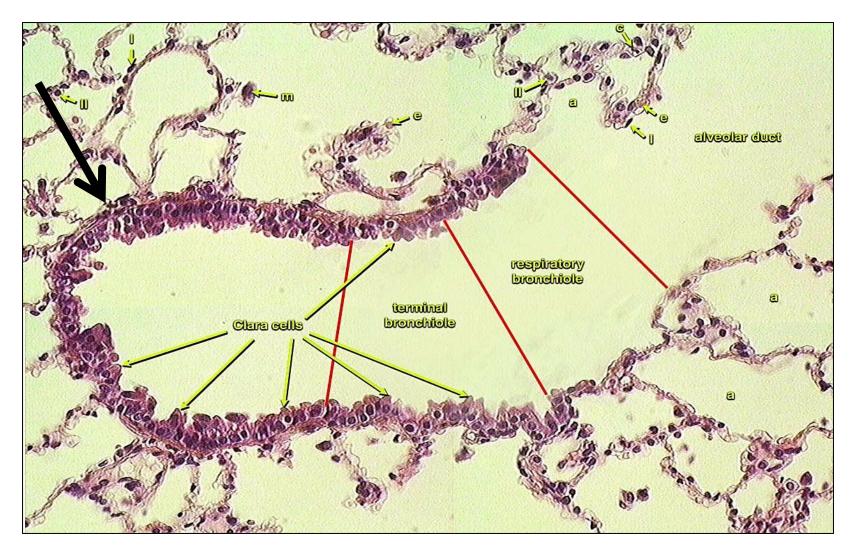

Clara cells with Some alveoli open in its wall

Alveolar ducts (AD):

- Alveoli open along its wall
- Lined e <u>squamous alveolar cells</u>
- At the distal end of AD <u>smooth m. disappear</u>, elastic & collagen fibers provide the only support

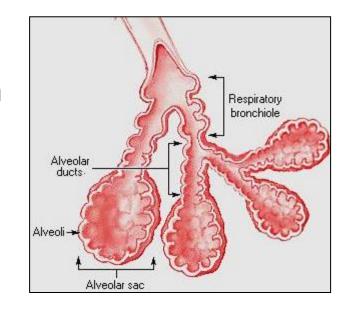

Section is showing terminal bronchiole and parts of the respiratory portion

Alveolar sacs (AS):

- Group of alveoli opens into common Central space
- Lined e squamous alveolar cells

<u>Alveoli</u>:

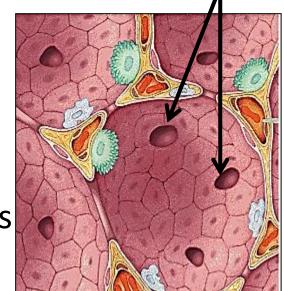

Structural & functional units of lung (gas exchange) Pores of Kohn

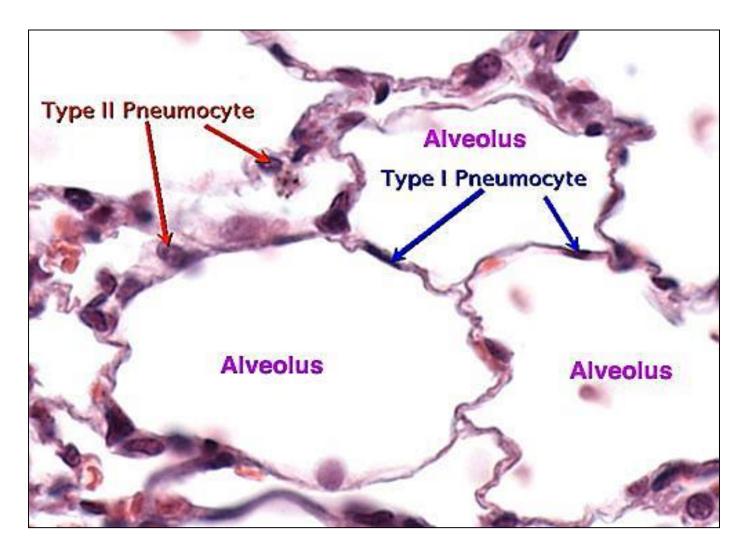

Alveoli found open into RB, AD, AS

They separated by inter-alveolar septa

 Alveolar pores of Kohn present in walls between alveoli (collateral ventilation ??)

 Lined e alveolar epith. formed of 2 types of cells type I & type II pneumocytes

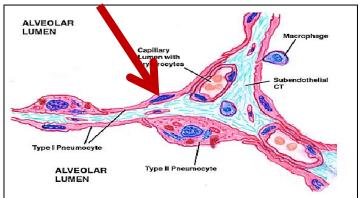

Type I and type II pneumocytes

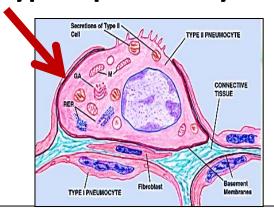

Lining epithelium of alveoli

Type I pneumocytes

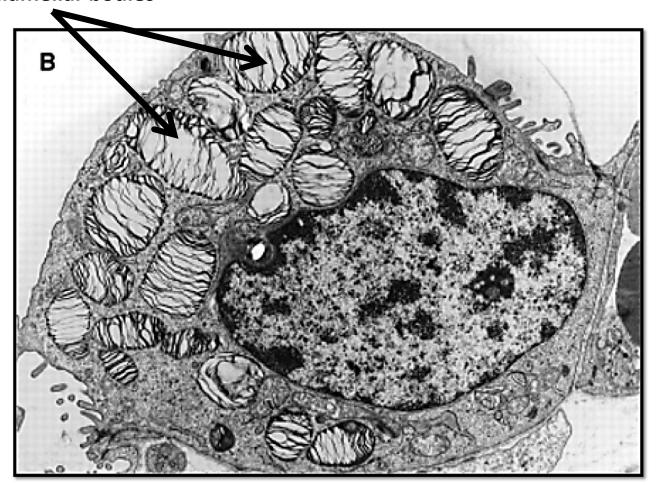

- Cover 97% of alveolar surface
- Flat simple squamous cells e flat nuclei
- cytoplasm has few organelles
- Cells joined together by tight junctions
- Gas exchange occurs through them

Type II pneumocytes

- Cover 3%
- Cuboidal cells e central nuclei & foamy cytoplasm
- Free surface has short microvilli
- Cytoplasm rich in organelles, multilamellar bodies
- Secrete surfactant (↓ tension & bactericidal)
- Act as stem cells
- Have ACE2 receptors where Covid-19 spikes attack

Multilamellar bodies

(E/M of type II pneumocyte)

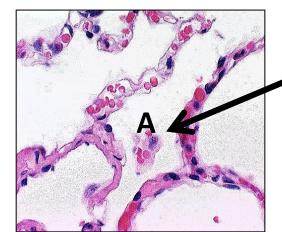

Respiratory Distress Syndrome (RDS): occurs In premature babies because surfactant appears in last weeks of gestation

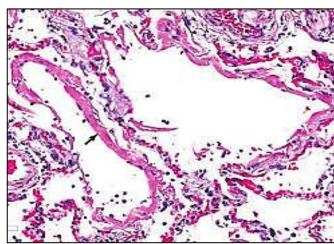

Interalveolar septa:

Delicate walls separate adjacent alveoli

Have richest capillary network

- Rich in elastic & reticular fibers
 (support & prevent over expansion)
- No smooth ms. cells
- Contains extravasated leucocytes
 (monocytes), which will migrate through the wall →
 to the lumen and become alveolar macrophages (A)
- This septa is destructed in emphysema & Covid 19

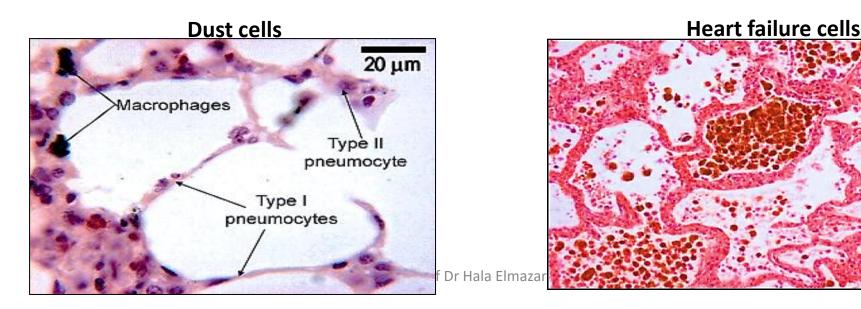

Alveolar phagocytes

 Blood monocytes → CT in alveolar septa → lumen of alveoli → macrophages

• 2 types of alveolar macrophages:

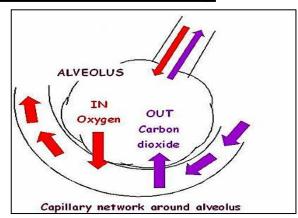

Dust cells: macrophages engulfing dust particles

Heart failure cells: macrophages engulfing erythrocytes (hemosidren granules) found in congestive heart failure

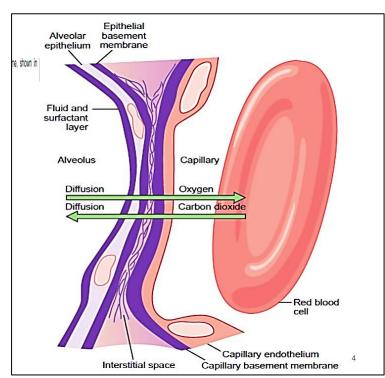

Blood- air barrier (respiratory membrane)

- ✓ Its where O₂& CO₂ cross for exchange
- ✓ Composed of 4 layers:
- Thin film of surfactant on the surface

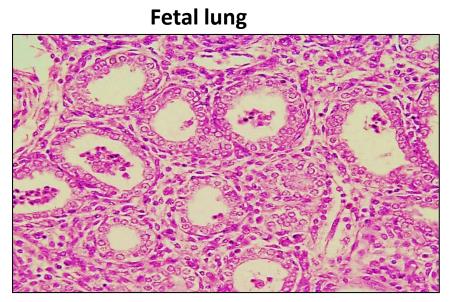

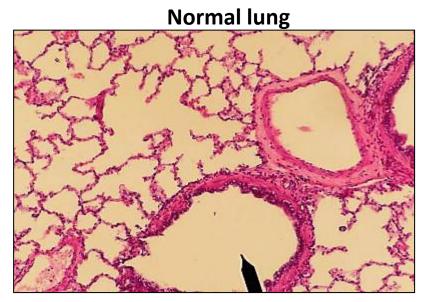

- Cytoplasm of type I pneumocyte
- Fused basal lamina of type I pneumocytes + capillary endothelia cells
- Cytoplasm of endothelial cells

Fetal Lung

- Lobulation is clear due to thick CT septa
- Fetal lung similar to gland in histological section
- Alveoli collapsed lined e simple cubical epith.
- Pulmonary BV are congested
- Whole lung sinks in water

Thank you
