

FRONT OF THE THIGH

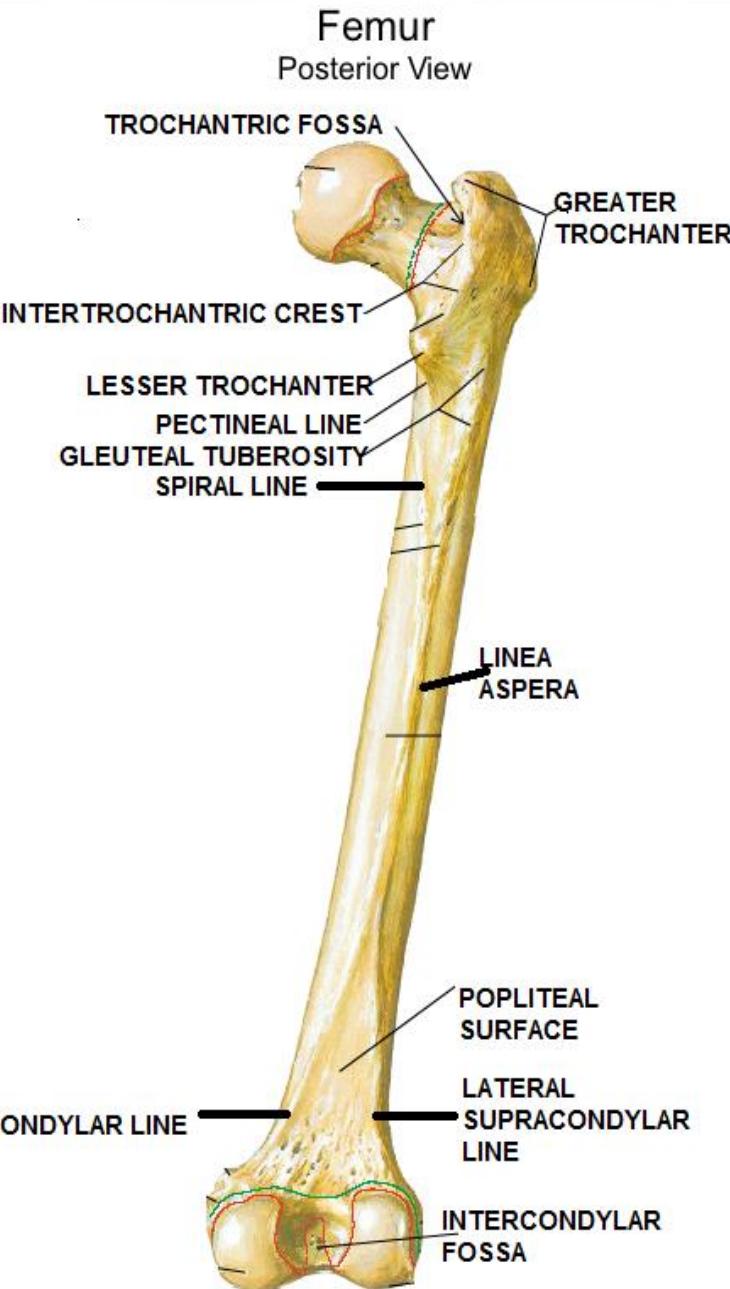

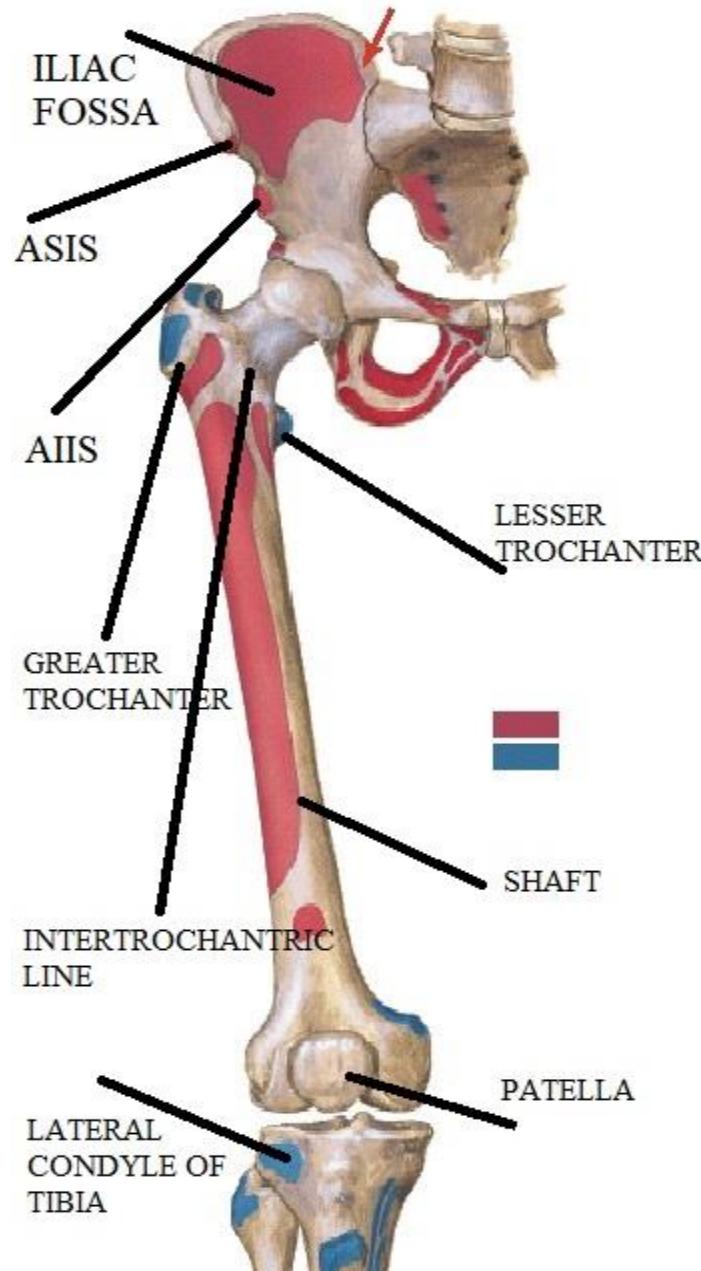

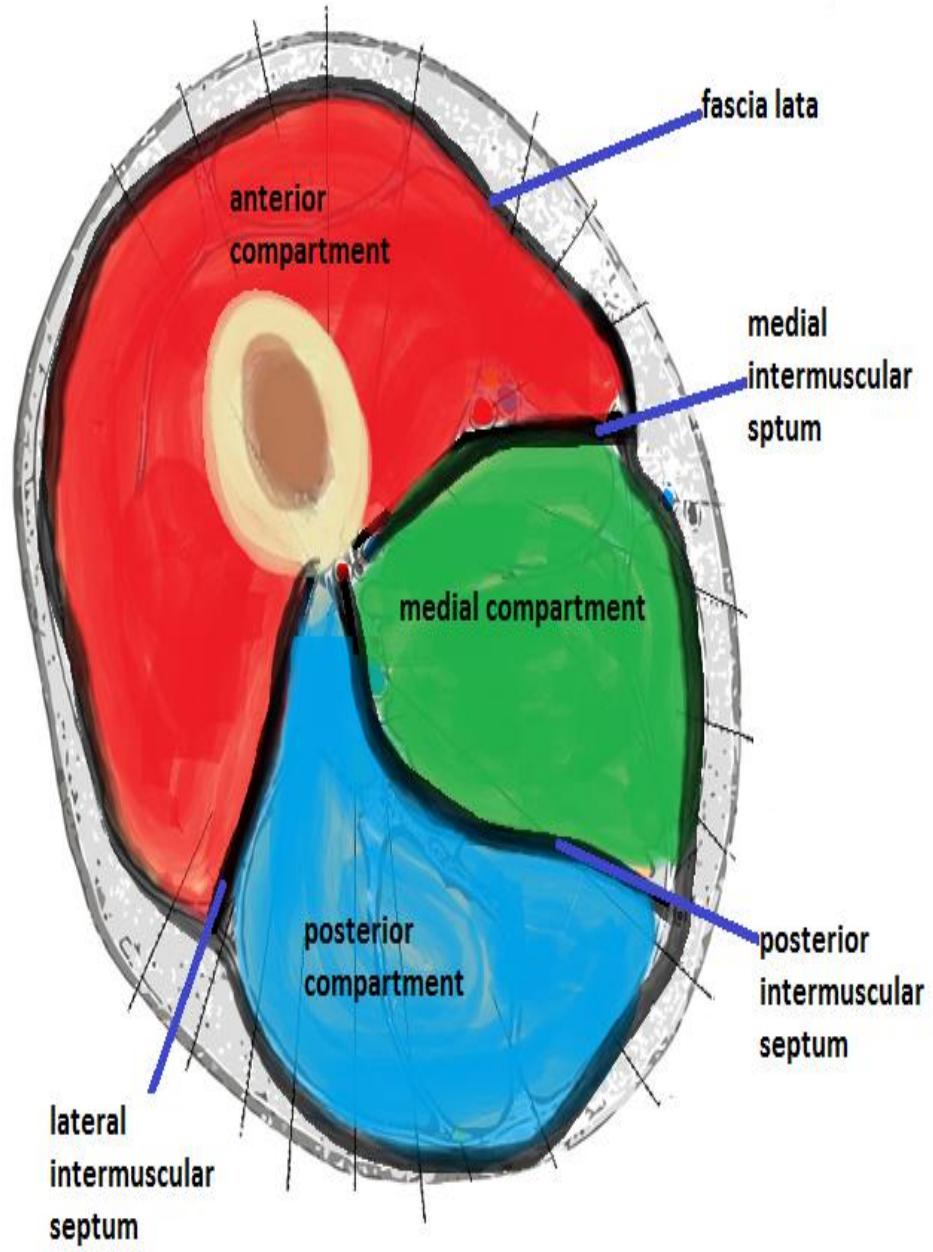

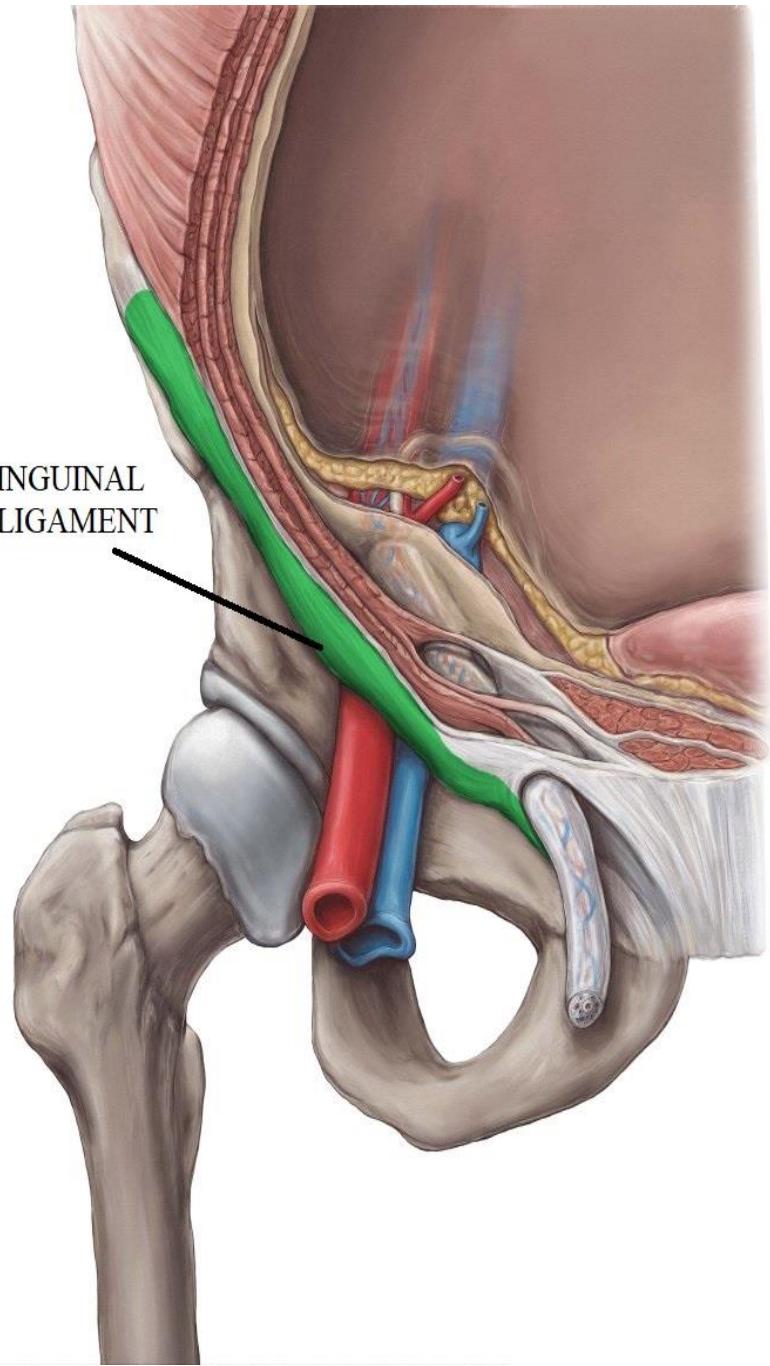

BY
DR ABULMAAATY MOHAMED
ASSISTANT PROFESSOR
ANATOMY & EMBRYOLOGY
MUTAH UNIVERSITY

SKELETON

SKELETON

SUPERFICIAL FASCIA OF THE THIGH

Contents:

A-cutaneous nerves:

1-Ilio inguinal n.:-

From the lumbar plexus

Supply the skin below medial part
of inguinal ligament

2-Femoral br. of genitofemoral n.:-

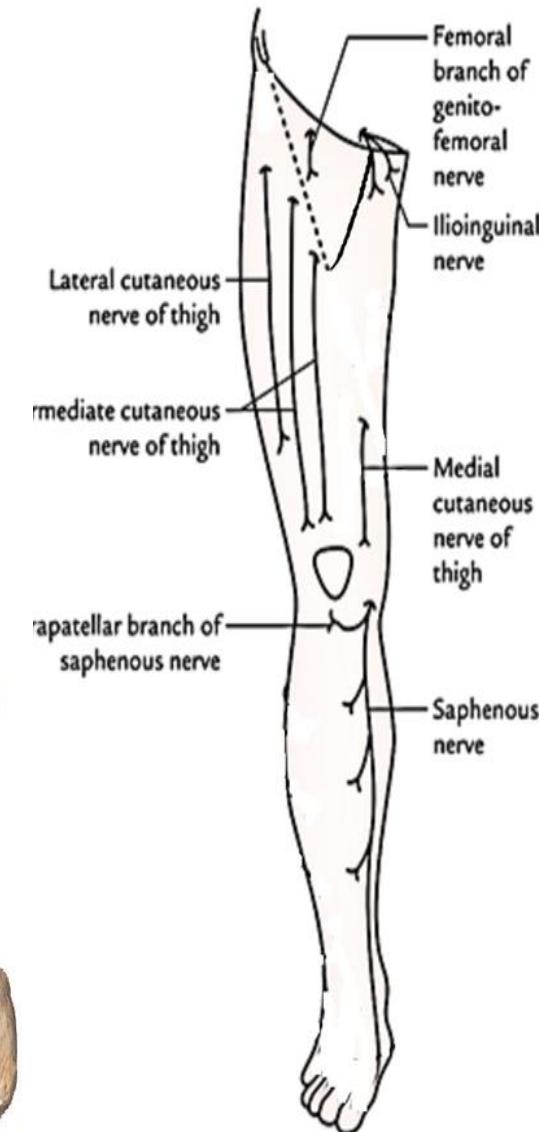

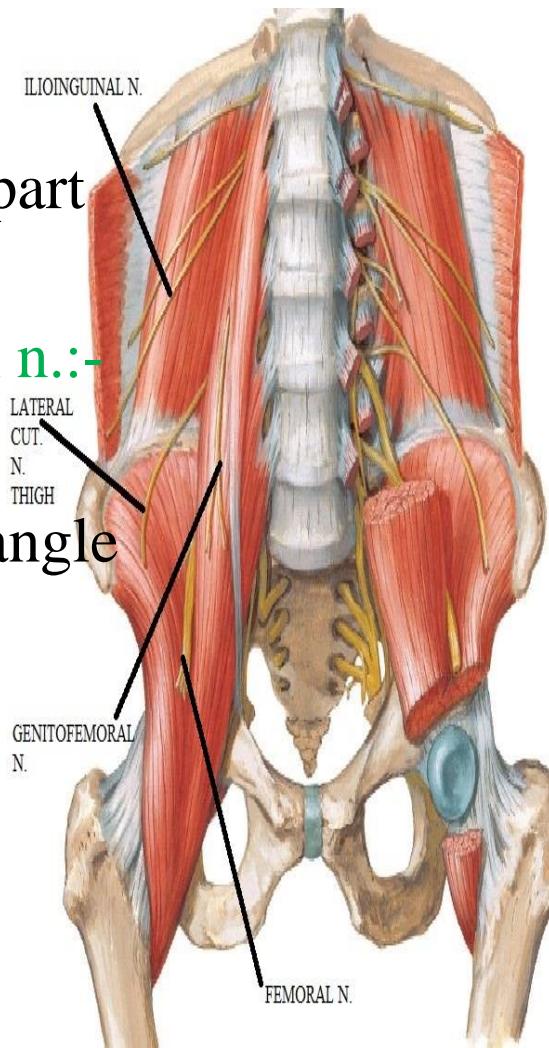

From the lumbar plexus

Supply the skin of femoral triangle

3-Lateral cut. n. of thigh :-

From the lumbar plexus

Supply the skin of lateral side
of thigh & knee

SUPERFICIAL FASCIA OF THE THIGH

Contents:

A-cutaneous nerves:

4-Intermediate cut. n. of thigh:-

From the femoral nerve

Divide into 2 branches

Supply the skin of front of thigh

5-Medial cut. n. of thigh :-

From the femoral nerve

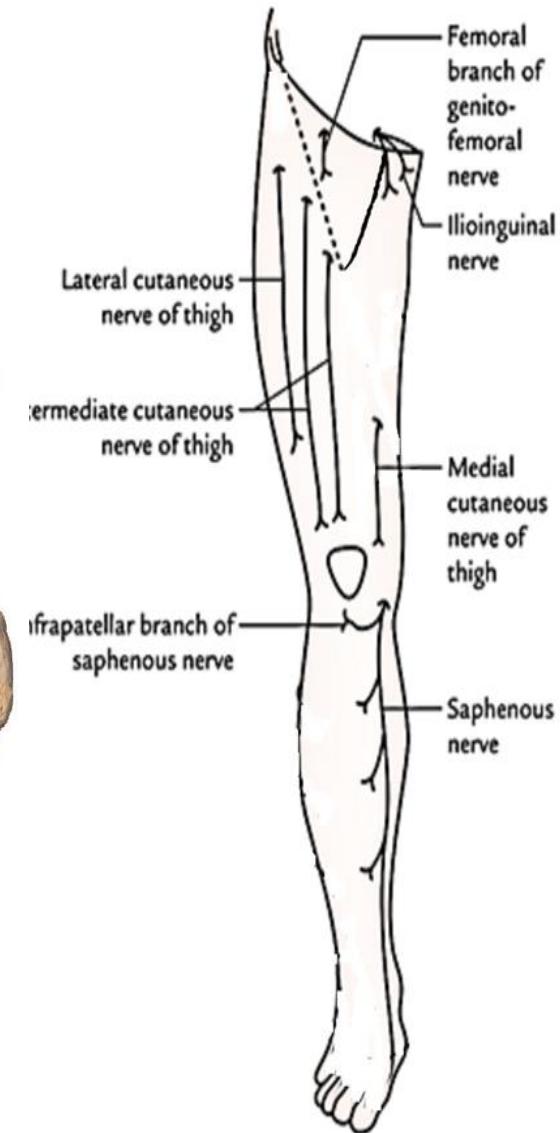

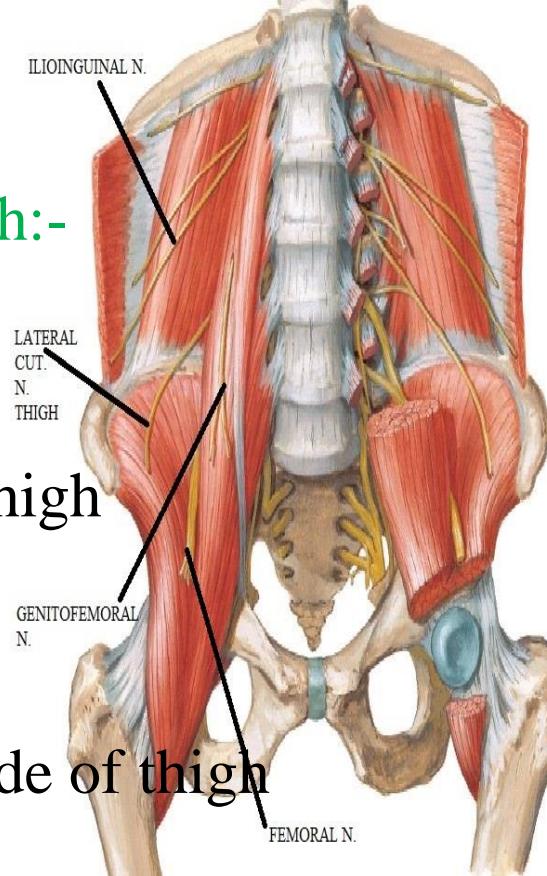

Supply the skin of medial side of thigh

N.B.: Patellar plexus:

Site: - In front of knee

Formation: - terminal branches of lateral, intermediate, medial cut. Nerves of Thigh

Plus infrapatellar branch of saphenous nerve

SUPERFICIAL FASCIA OF THE THIGH

Contents:

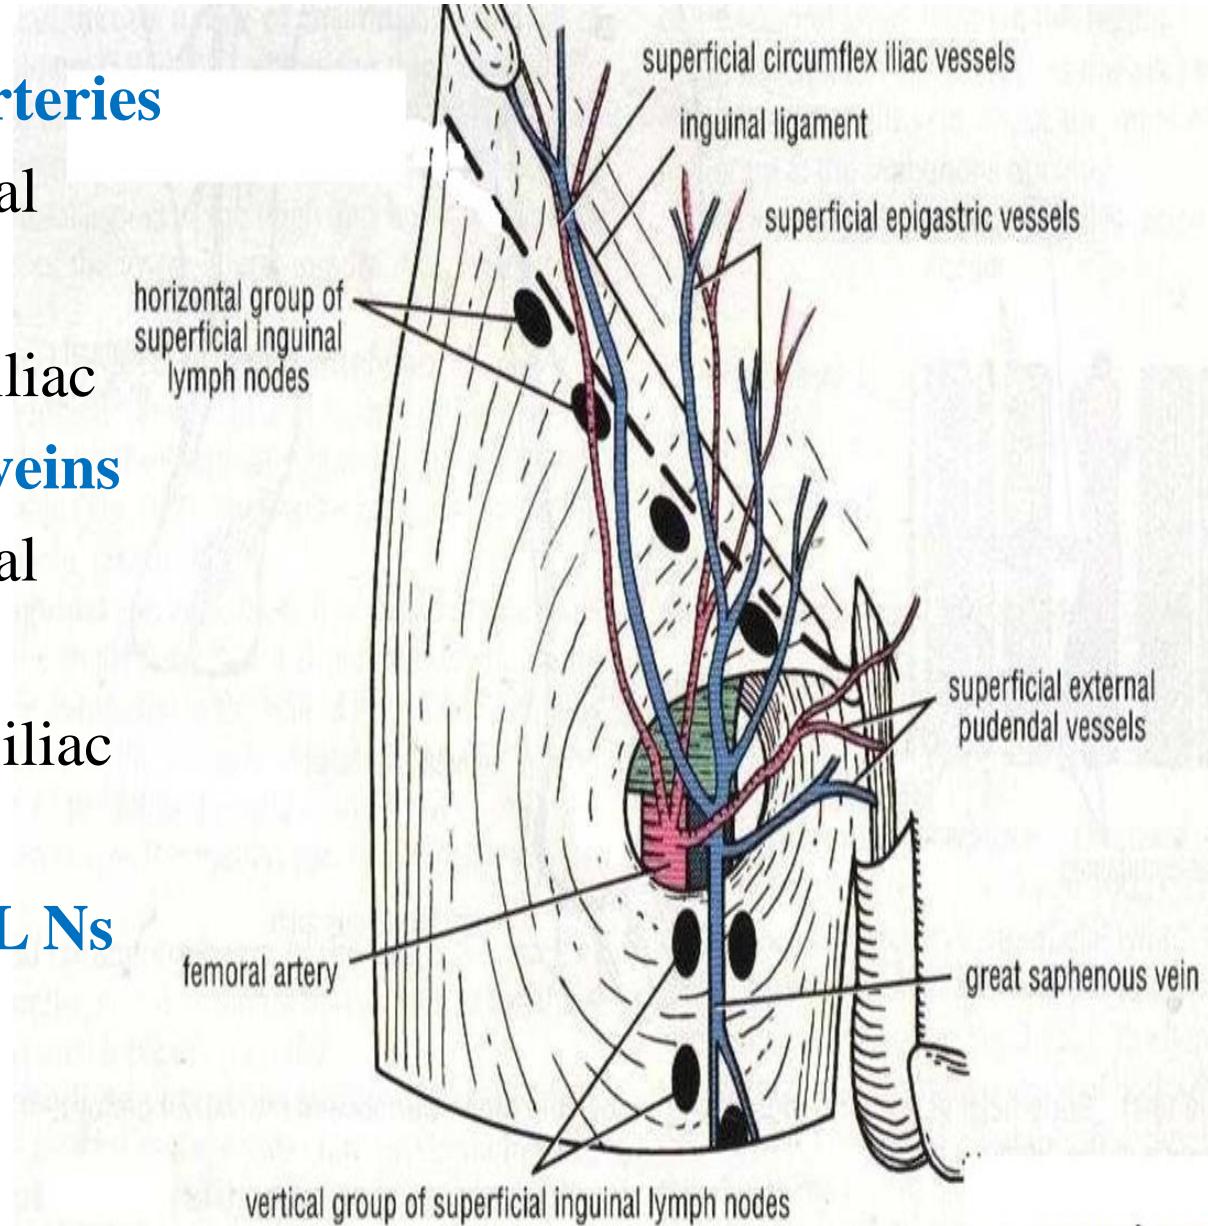

B-superficial inguinal arteries

- 1-Superficial ext. pudendal
- 2-superficial epigastric
- 3-Superficial circumflex iliac

C- Superficial inguinal veins

- 1-Superficial ext. pudendal
- 2-superficial epigastric
- 3-Superficial circumflex iliac
- 4-& great saphenous v

D- superficial inguinal L Ns

DEEP FASCIA OF THE THIGH (FASCIA LATA)

Special features :

A-saphenous opening :

Def.: oval opening in deep fascia

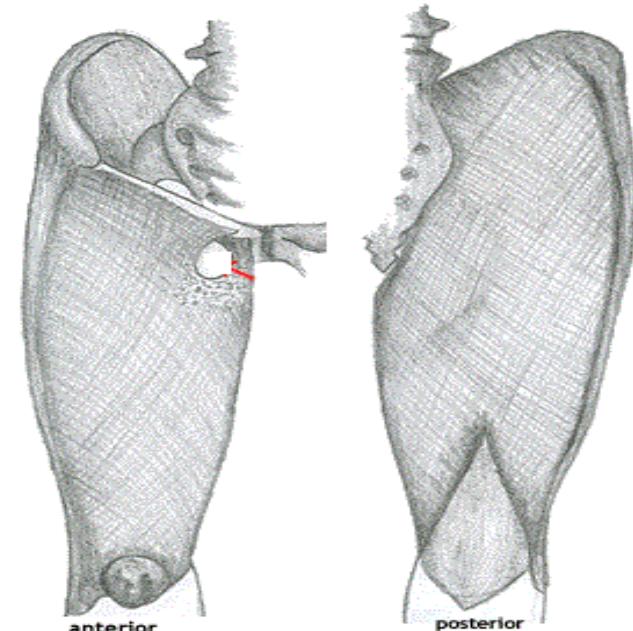

4 cm below & lateral to pubic tubercle.

pierced by:

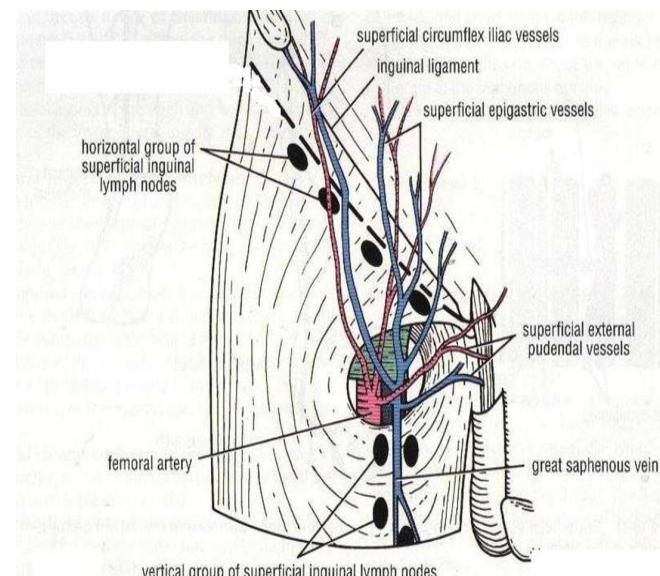

1- Superficial inguinal arteries??

2- Great saphenous V.

3-lymphatics from superficial to deep inguinal LN.

fascia lata

DEEP FASCIA OF THE THIGH (FASCIA LATA)

Special features :

B-iliotibial tract:

Def.: thickened deep fascia of lateral side of thigh

Attachment:

Above: tubercle of iliac crest

Below: front of lateral tibial condyle
head of fibula
lateral side of patella
capsule of knee joint

Attached structures:

1-tensor fascia lata : ant. border

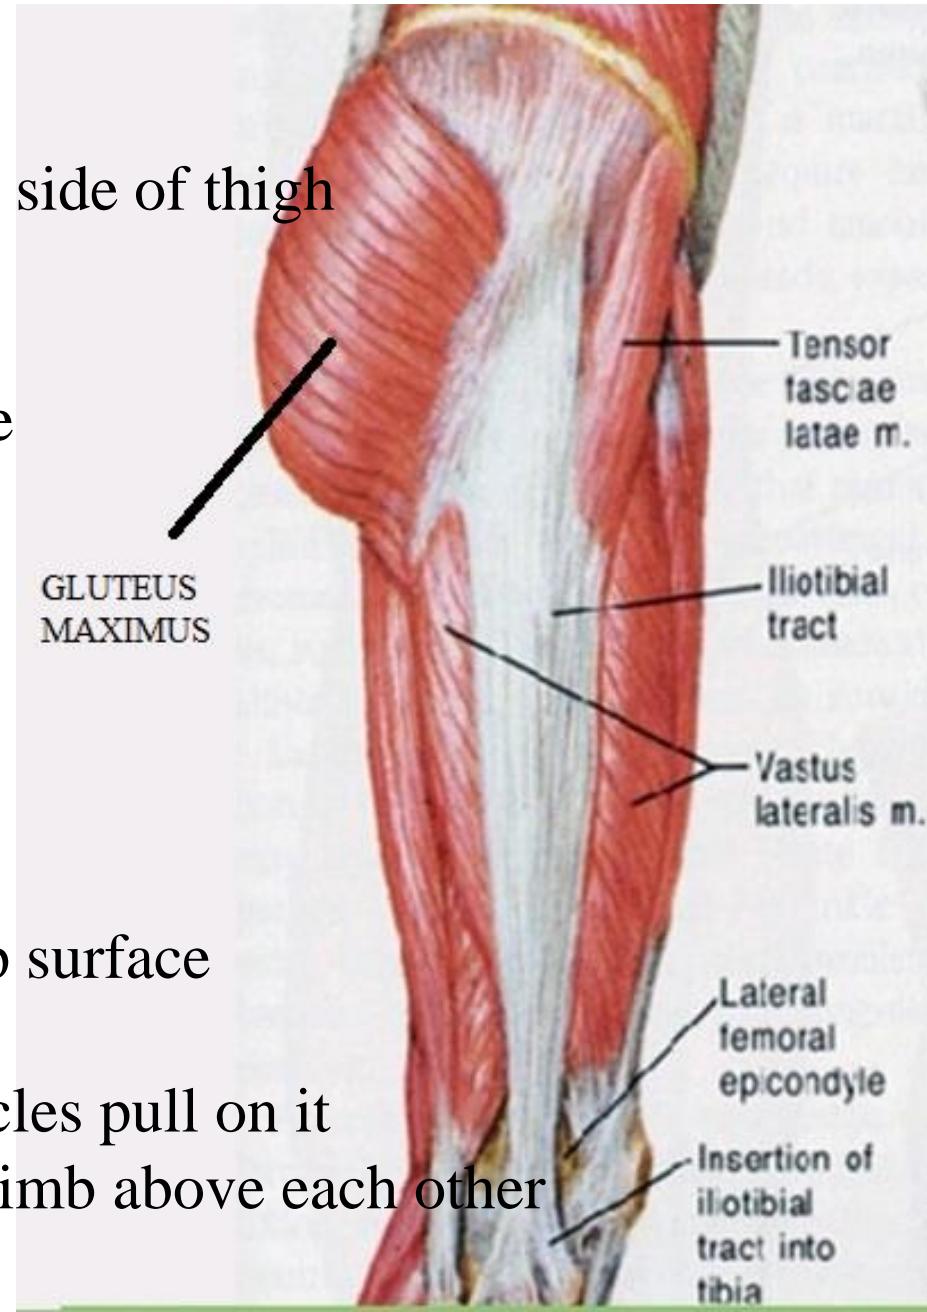

2-gluteus Maximus: post. border

3-lateral intermuscular septum: deep surface

Function:

In standing position the above muscles pull on it

→ Tense → keep bones of lower limb above each other

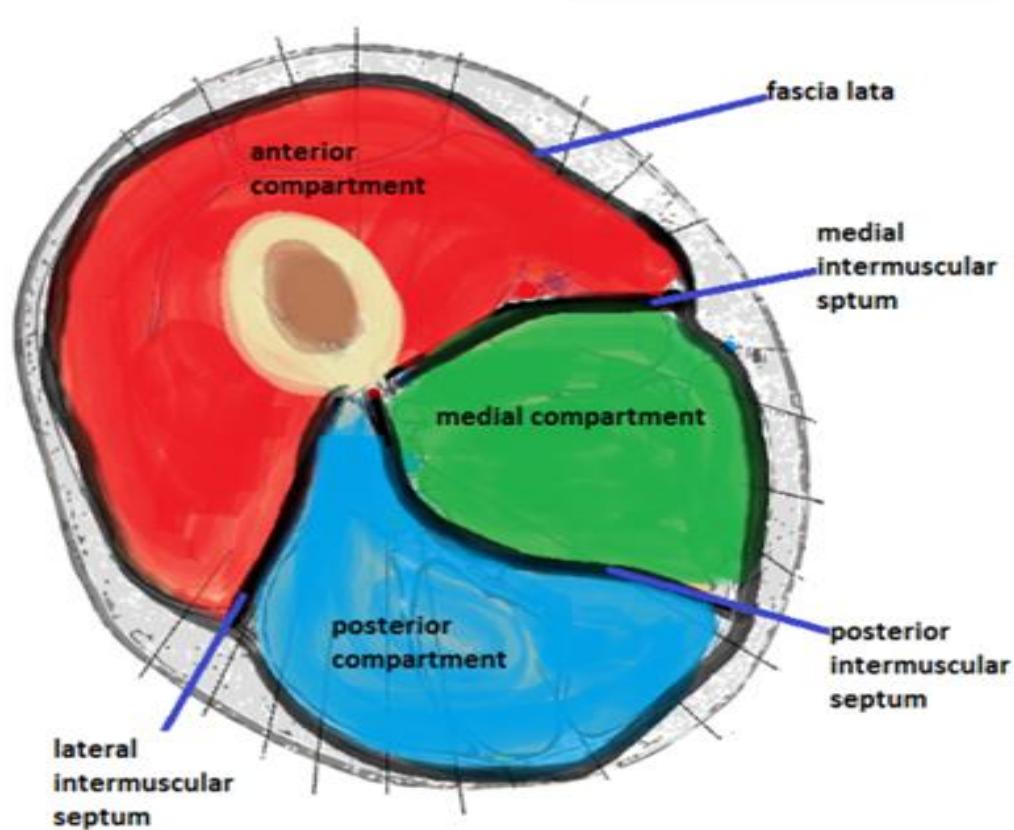

DEEP FASCIA OF THE THIGH (FASCIA LATA)

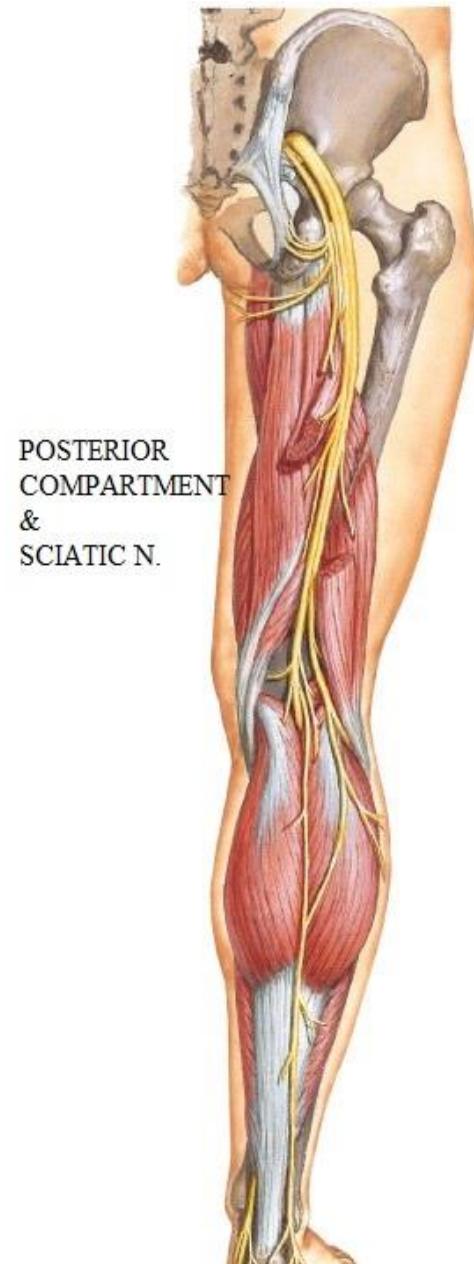

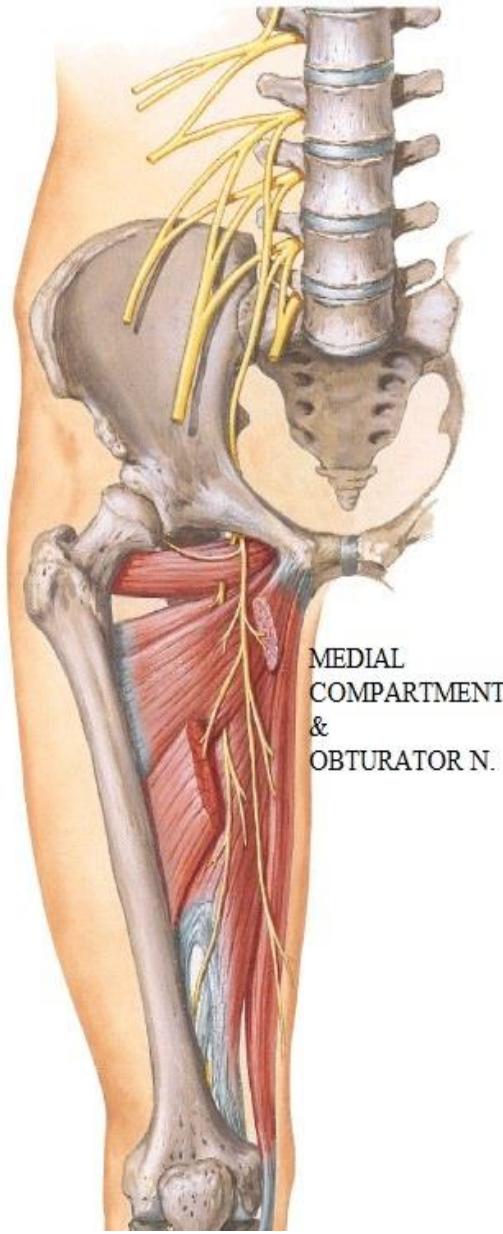

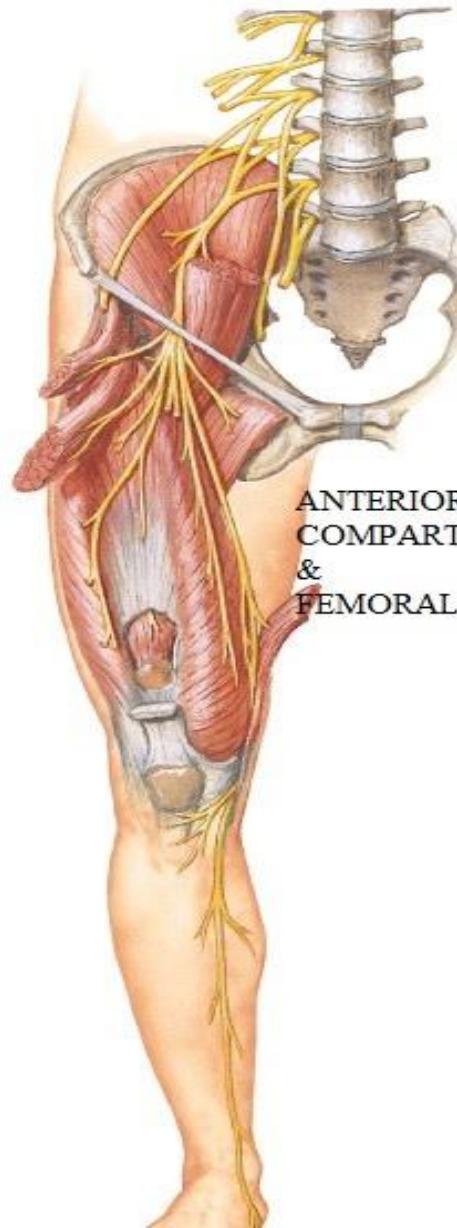

Special features :

C-inter muscular septa:

- medial, lateral, post. → linea aspera of femur
- divide thigh into ant. , medial, post. Compartments

MUSCLES OF THE THIGH

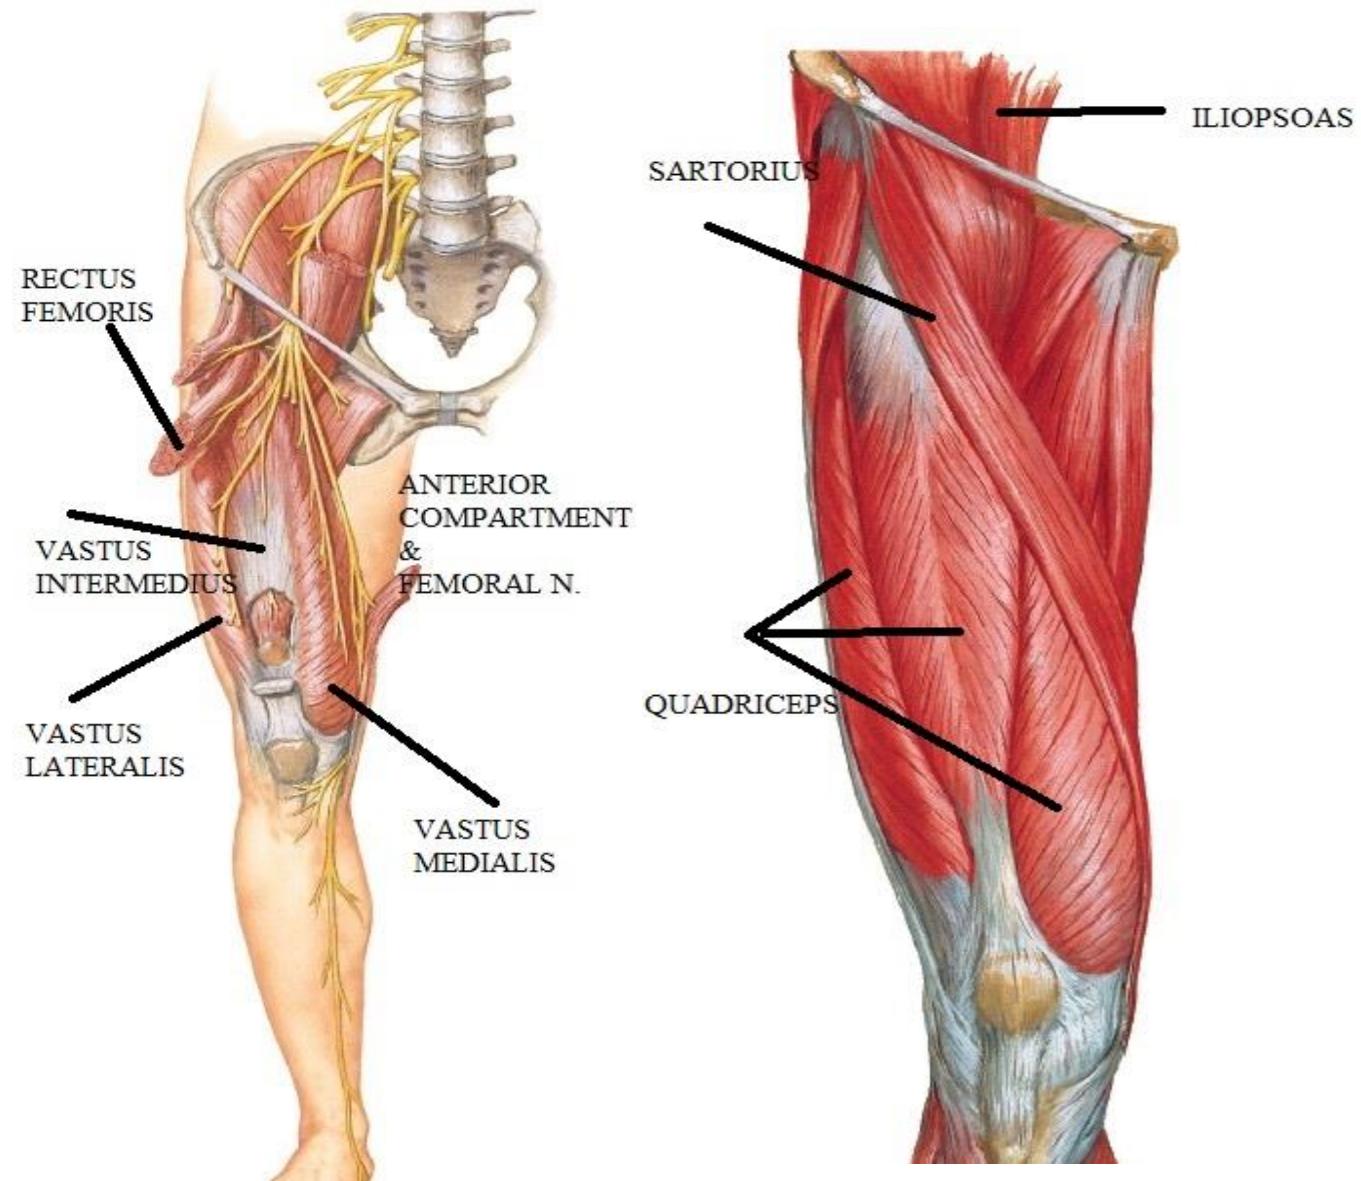

MUSCLES OF THE ANTERIOR COMPARTMENT

1-QUADRICEPS FEMORIS:- largest muscle in the body

2- ILIOPSOAS

3- SARTORIUS

MUSCLES OF THE ANTERIOR COMPARTMENT

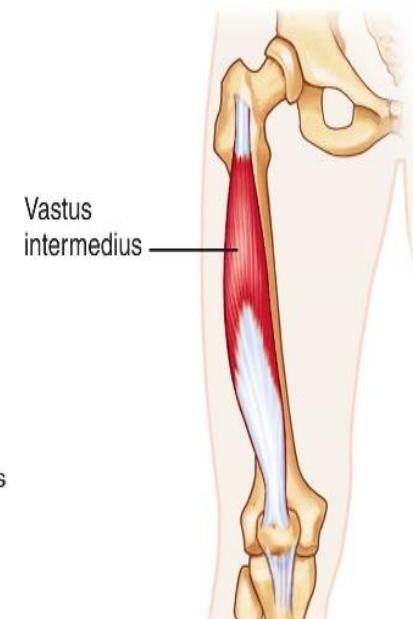

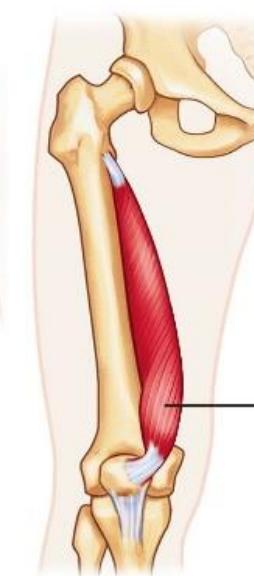

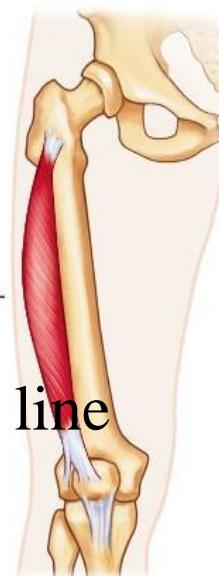

QUADRICEPS FEMORIS

Origin: 4 heads

Vastus intermedius:

upper 2/3 of ant. & lateral
surfaces of shaft of femur

Vastus
lateralis

Vastus medialis :

lower part of inter trochanteric line

Spiral line

Linea aspera

Medial supracondylar line

Vastus lateralis :

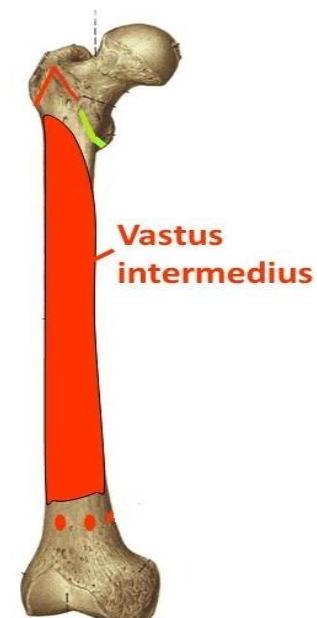

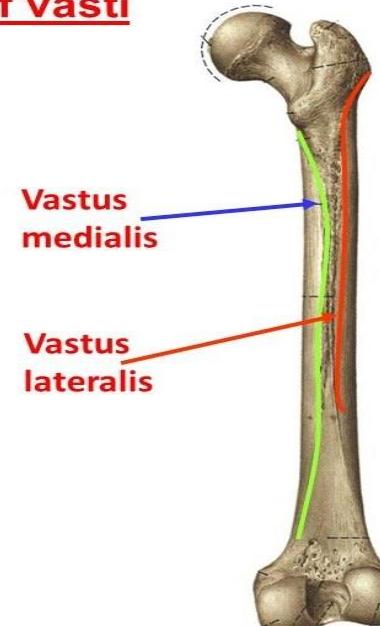

upper part of inter trochanteric line

Root of greater trochanter

Gluteal tuberosity

Linea aspera

Origin of vasti

MUSCLES OF THE ANTERIOR COMPARTMENT

QUADRICEPS FEMORIS

Origin: 4 heads

Rectus femoris:

straight head: ant. inf. iliac spine

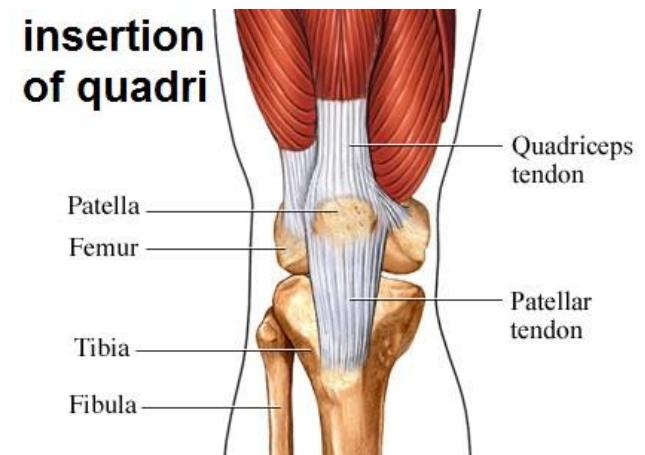

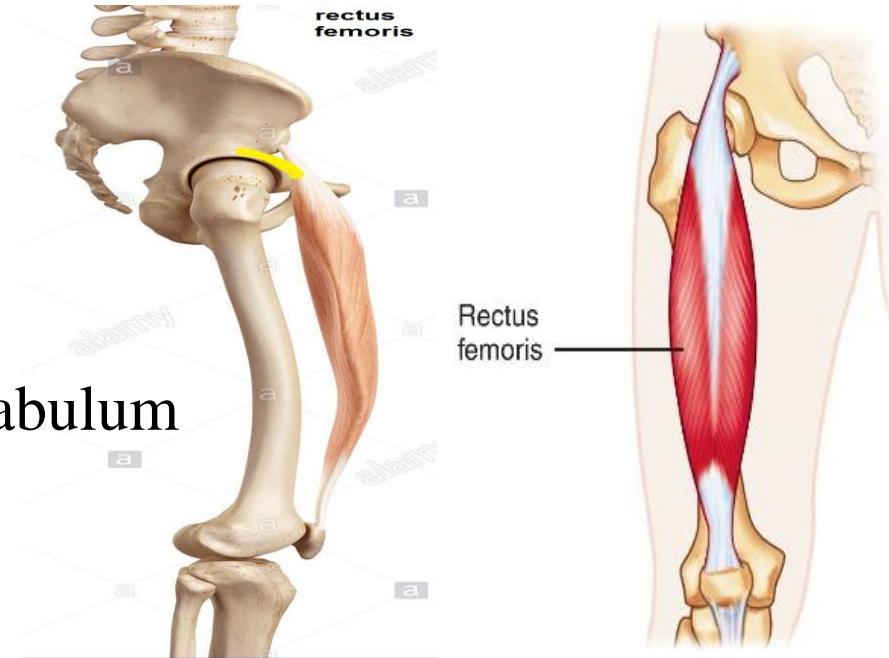

Reflected head: groove above acetabulum
(in the ileum)

Insertion:

-base of patella

and lower fibers of vastus medialis& lateralis insert in sides of patella

-ligamentum patellae transmit insertion
from apex of patella to tibial tuberosity.

MUSCLES OF THE ANTERIOR COMPARTMENT

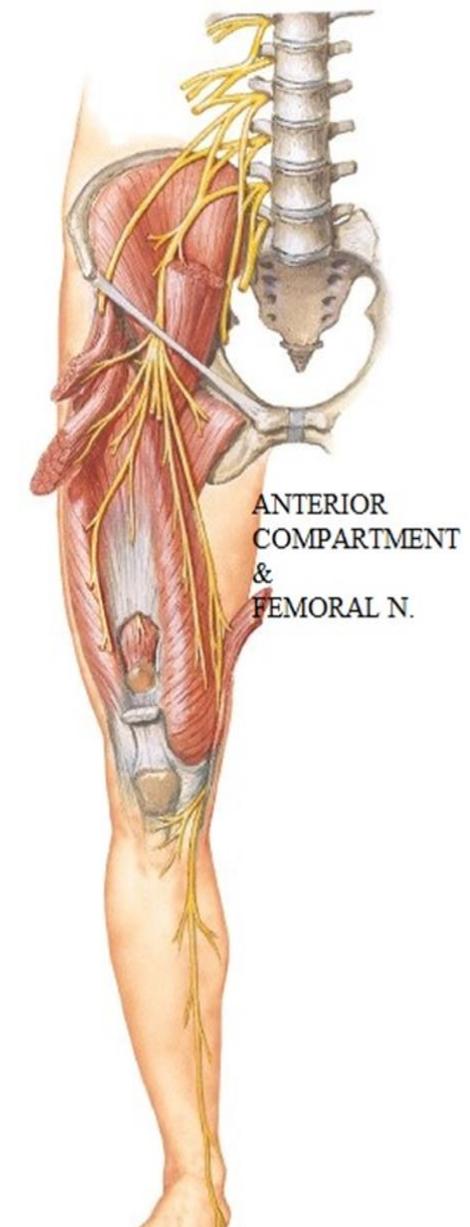

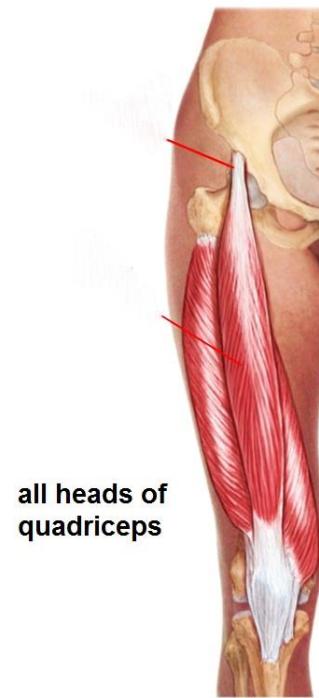

QUADRICEPS FEMORIS

Action

- all the muscle: main extensor of knee
- fibers of medialis & lateralis
that attach to sides of patella
stabilize it during contraction of quadriceps.

- Rectus femoris: flexion of hip joint

N.S: Femoral n. br. to each head

MUSCLES OF THE ANTERIOR COMPARTMENT

ILIOPSOAS

Origin:-

Iliacus :- Iliac fossa

psoas major:

T 12 & lumbar vertebrae:
sides of bodies & transverse
processes

I.:-

Lesser trochanter

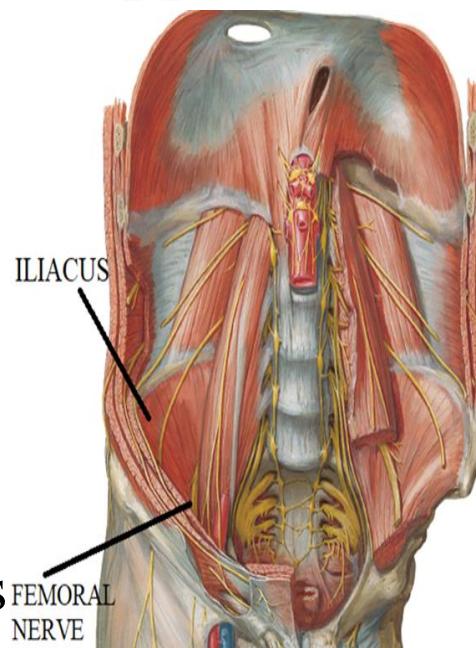

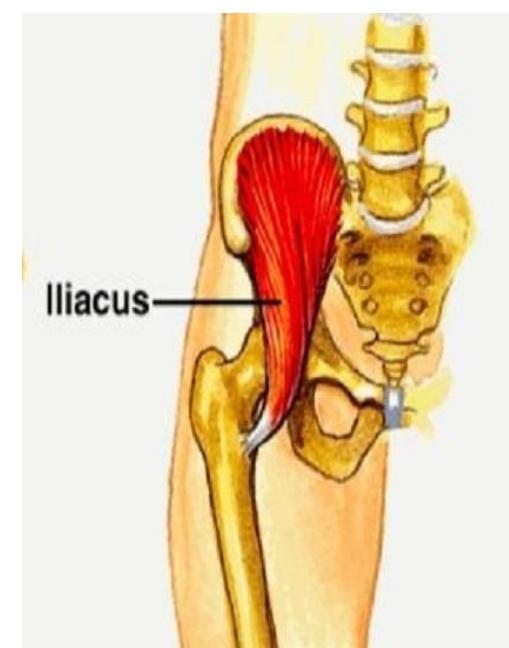

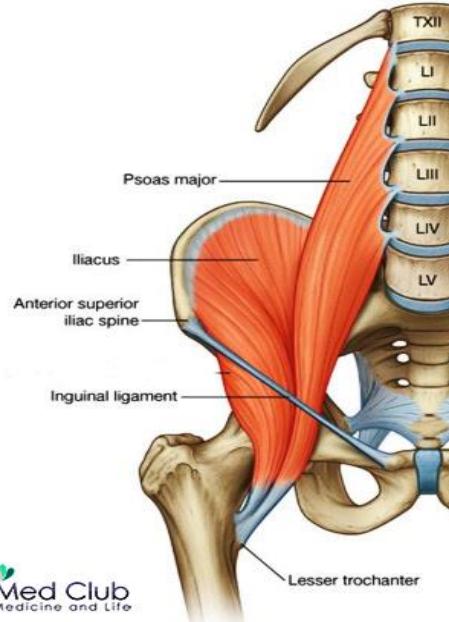

A.:-

Flexion &
lateral rotation of thigh

N.S.:-

Iliacus :- femoral nerve

PSOAS MAJOR Lumbar plexus

MUSCLES OF THE ANTERIOR COMPARTMENT

Sartorius

Origin:-

Ant. superior iliac spine (ASIS)

Insertion:-

upper part of medial
surface of tibia

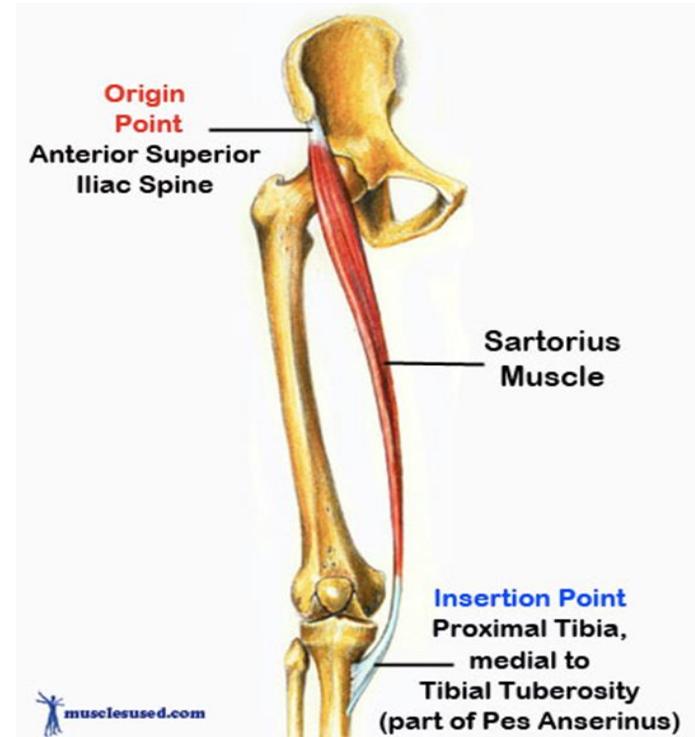

Action:-

sartor's (cross leg)

- (tailor's) Position :
flexion , medial rotation of knee &
flexion & abduction &lateral
rotation of hip
- guy rope : support pelvis above femur

N.S.: -

femoral n.

MUSCLES OF THE ANTERIOR COMPARTMENT

Sartorius

The sartorius and the muscles of the pes anserinus
